# **Operation Manual**

Revised March 2005

## Notice:

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.

The following conventions are used to indicate and classify precautions in this manual. Always heed the information provided with them. Failure to heed precautions can result in injury to people or damage to property.

- **DANGER** Indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.
- **WARNING** Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
- **Caution** Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury, or property damage.

## **OMRON Product References**

All OMRON products are capitalized in this manual. The word "Unit" is also capitalized when it refers to an OMRON product, regardless of whether or not it appears in the proper name of the product.

The abbreviation "Ch," which appears in some displays and on some OMRON products, often means "word" and is abbreviated "Wd" in documentation in this sense.

The abbreviation "PLC" means Programmable Controller. "PC" is used, however, in some Programming Device displays to mean Programmable Controller.

## Visual Aids

The following headings appear in the left column of the manual to help you locate different types of information.

- **Note** Indicates information of particular interest for efficient and convenient operation of the product.
- *1,2,3...* 1. Indicates lists of one sort or another, such as procedures, checklists, etc.

## About this Manual:

This manual describes the installation and operation of the CS/CJ-series Analog I/O Units and includes the sections described below.

In this manual, "Analog I/O Units" is a product group name for the following groups of Units.

	Name	Model number
CS-series	Isolated-type Thermocouple Input Unit	CS1W-PTS01-V1
		CS1W-PTS11
		CS1W-PTS51
		CS1W-PTS55
	Isolated-type Resistance Thermometer Input Unit (Pt100 or JPt100)	CS1W-PTS02
	Isolated-type Resistance Thermometer Input Unit (Ni508.4)	CS1W-PTS03
	Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100, Pt50, or Ni508.4)	CS1W-PTS12
	Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)	CS1W-PTS52
		CS1W-PTS56
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Unit	CS1W-PDC01
		CS1W-PDC11
		CS1W-PDC55
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit	CS1W-PTR02
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Isolated-type Analog Output Unit	CS1W-PMV01/PMV02
CJ-series	Isolated-type Thermocouple Input Unit	CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)	CJ1W-PTS52
	Isolated-type Resistance Thermometer input (Pt100, JPt100, Pt50 or Ni508.4)	CJ1W-PTS16
	Isolated-type Direct Current Input Unit	CJ1W-PDC15

Please read this manual carefully and be sure you understand the information provided before attempting to install and operate the Analog I/O Units.

*Section 1* presents an overview of the CS/CJ-series Analog I/O Units, and outlines their common features.

Section 2 describes each of the CS-series Analog I/O Units in detail.

Section 3 describes each of the CJ-series Analog I/O Units in detail.

Appendix A provides a supplementary explanation of Unit functions.

Appendix B provides an example of zero/span adjustment.

WARNING Failure to read and understand the information provided in this manual may result in personal injury or death, damage to the product, or product failure. Please read each section in its entirety and be sure you understand the information provided in the section and related sections before attempting any of the procedures or operations given.

## PRECAUTIONS

This section provides general precautions for using the CS/CJ-series Programmable Controllers (PLCs) and related devices.

The information contained in this section is important for the safe and reliable application of Programmable Controllers. You must read this section and understand the information contained before attempting to set up or operate a PLC system.

1	Intended	1 Audience	xii
2	General	Precautions	xii
3	Safety F	Precautions	xii

	6-1	Applicable Directives	xvi
	6-2	Concepts	xvi
	6-3	Conformance to EC Directives	xvi
	6-4	Conditions for Complying with EC Directives	xvii

## 1 Intended Audience

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

- Personnel in charge of installing FA systems.
- Personnel in charge of designing FA systems.
- Personnel in charge of managing FA systems and facilities.

## 2 General Precautions

The user must operate the product according to the performance specifications described in the operation manuals.

Before using the product under conditions which are not described in the manual or applying the product to nuclear control systems, railroad systems, aviation systems, vehicles, combustion systems, medical equipment, amusement machines, safety equipment, and other systems, machines, and equipment that may have a serious influence on lives and property if used improperly, consult your OMRON representative.

Make sure that the ratings and performance characteristics of the product are sufficient for the systems, machines, and equipment, and be sure to provide the systems, machines, and equipment with double safety mechanisms.

This manual provides information for programming and operating the Unit. Be sure to read this manual before attempting to use the Unit and keep this manual close at hand for reference during operation.

**WARNING** It is extremely important that a PLC and all PLC Units be used for the specified purpose and under the specified conditions, especially in applications that can directly or indirectly affect human life. You must consult with your OMRON representative before applying a PLC System to the above-mentioned applications.

## 3 Safety Precautions

- WARNING Do not attempt to take any Unit apart while the power is being supplied. Doing so may result in electric shock.
- WARNING Provide safety measures in external circuits (i.e., not in the Programmable Controller), including the following items, to ensure safety in the system if an abnormality occurs due to malfunction of the PLC or another external factor affecting the PLC operation. Not doing so may result in serious accidents.
  - Emergency stop circuits, interlock circuits, limit circuits, and similar safety measures must be provided in external control circuits.
  - Unless otherwise stated, the PLC will turn OFF all outputs when its selfdiagnosis function detects any error or when a severe failure alarm (FALS) instruction is executed. (The operation of outputs from Analog Output Units is described later in this manual.) As a countermeasure for such errors, external safety measures must be provided to ensure safety in the system. (The external alarm output on the CS1W-PTS51/PTS52, CJ1W-PTS51/PTS52, however, will be ON.)
  - The PLC outputs may remain ON or OFF due to deposition or burning of the output relays or destruction of the output transistors. As a countermeasure for such problems, external safety measures must be provided to ensure safety in the system.
  - When the 24-VDC output (service power supply to the PLC) is overloaded or short-circuited, the voltage may drop and result in the outputs being turned OFF. As a countermeasure for such problems, external safety measures must be provided to ensure safety in the system.

1

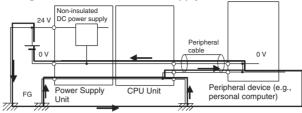

WARNING Always turn OFF the power supply to the PLC before attempting any of the following. Not turning OFF the power supply may result in malfunction or electric shock.

- Mounting or dismounting the Power Supply Units, I/O Units, CPU Units, or any other Units.
- Assembling the Units.
- Setting DIP switches or rotary switches.
- Connecting cables or wiring the system.
- Connecting or disconnecting the connectors.
- WARNING Do not attempt to disassemble, repair, or modify any Units. Any attempt to do so may result in malfunction, fire, or electric shock.
  - Caution Execute online edit only after confirming that no adverse effects will be caused by extending the cycle time. Otherwise, input signals may not be readable.

## 4 **Operating Environment Precautions**

**Caution** Do not operate the control system in the following locations:

- Locations subject to direct sunlight.
- Locations subject to temperatures or humidity outside the range specified in the specifications.
- Locations subject to condensation as the result of severe changes in temperature.
- Locations subject to corrosive or flammable gases.
- Locations subject to dust (especially iron dust) or salts.
- Locations subject to exposure to water, oil, or chemicals.
- Locations subject to shock or vibration.
- Caution Take appropriate and sufficient countermeasures when installing systems in the following locations:
  - Locations subject to static electricity or other forms of noise.
  - Locations subject to strong electromagnetic fields.
  - Locations subject to possible exposure to radioactivity.
  - Locations close to power supplies.
- Caution The operating environment of the PLC System can have a large effect on the longevity and reliability of the system. Improper operating environments can lead to malfunction, failure, and other unforeseeable problems with the PLC System. Be sure that the operating environment is within the specified conditions at installation and remains within the specified conditions during the life of the system.
- ▲ Caution When connecting a personal computers or other peripheral devices to a PLC to which a non-insulated Power Supply Unit (CJ1W-PD022) is mounted, either ground the 0 V side of the external power supply or do not ground the external power supply at all ground. A short-circuit will occur in the external power supply if incorrect grounding methods are used. Never ground the 24 V side, as shown below.

Wiring in Which the 24-V Power Supply Will Short

## 5 Application Precautions

Observe the following precautions when using the Analog I/O Unit.

- If any one of cold junction compensating elements is disconnected, no compensation will be performed, resulting in improper temperature measurement. Do not disconnect cold junction compensating elements. (Applicable to the CS1W-PTS01-V1, PTS11/PTS51/PTS55 or CJ1W-PTS51/PTS15 Isolated-type Thermocouple Input Unit.)
- Each cold junction compensation element is calibrated for the individual Unit and connected circuit; do not use elements from other Units or replace two elements of the same Unit. Doing so will result in improper temperature measurement. Use elements attached at the time of product delivery. (Applicable to the CS1W-PTS01-V1, PTS11/PTS51/PTS55 or CJ1W-PTS51/PTS15 Isolated-type Thermocouple Input Unit.)
- If the external 24-V power supply for the CJ1W-PTS15/PTS16 or CJ1W-PDC15 drops below the specified voltage range, the Power Supply Flag will turn OFF, the Sensor Error Flag will turn ON, and the conversion data will be fixed at the upper limit or lower limit values. Prevent this effect on the control system operation by using these flags in the input data read conditions or implement other measures in the user program.
- When using the CS1W-PTS15/PTS16 or CS1W-PDC15, make sure that the external 24-VDC power supply is isolated.
- Check the user program for proper execution before actually running it on the Unit. Not checking the program may result in an unexpected operation.
- Fail-safe measures must be taken by the customer to ensure safety in the event of incorrect, missing, or abnormal signals caused by broken signal lines, momentary power interruptions, or other causes.
- Install a breaker or take other safety measures against short-circuiting of external wiring.
- Confirm that no adverse effect will occur in the system before attempting any of the following. Not doing so may result in an unexpected operation.
  - Changing the operating mode of the PLC (including the setting of the startup operating mode).
  - · Force-setting/force-resetting any bit in memory.
  - Changing the present value of any word or any set value in memory.
- Be sure that all the mounting screws, terminal screws, and cable connector screws are tightened to the torque specified in this manual. Incorrect tightening torque may result in malfunction.
- Be sure that the terminal blocks, expansion cables, and other items with locking devices are properly locked into place. Improper locking may result in malfunction.
- Take appropriate measures to ensure that the specified power with the rated voltage and frequency is supplied in places where the power supply is unstable. An incorrect power supply may result in malfunction.
- Leave the label attached to the Unit when wiring. Removing the label may result in malfunction if foreign matter enters the Unit.

- Remove the label after the completion of wiring to ensure proper heat dissipation. Leaving the label attached may result in malfunction.
- Use crimp terminals for wiring. Do not connect bare stranded wires directly to terminals. Connection of bare stranded wires may result in burning.
- Be sure to use the power supply voltage specified in this manual.
- Do not apply voltages to the input section in excess of the rated input voltage. Excess voltages may result in burning.
- Do not apply voltages or connect loads to the output section in excess of the maximum switching capacity. Excess voltage or loads may result in burning.
- Double-check all wiring, switch settings, and data memory (DM) settings before turning ON the power supply. Incorrect wiring may result in burning.
- Resume operation only after transferring to the new CPU Unit the contents of the DM Area, HR Area, and other data required for resuming operation. Not doing so may result in an unexpected operation.
- Do not drop the product or subject it to excessive vibration or shock.
- Touch a grounded piece of metal to discharge static electricity from your body before touching a Unit.
- Check the terminal block completed before mounting it.
- Install circuit breakers or take other countermeasures against short-circuits in external wiring.
- Install Units as far as possible away from devices that generate strong, high-frequency noise.
- Check to be sure that all switches and memory contents, such as the DIP Switches and the contents of the DM Area) are correct before starting operation.
- Do not pull on cables or bend them past their natural bending radius.
- Do not place any objects on top of cables.
- When wiring crossovers between terminals, the total current for both terminals will flow in the line. Check the current capacities of all wires before wiring crossovers.
- The following precautions apply to Power Supply Units with Replacement Notification.
  - When the LED display on the front of the Power Supply Unit starts to alternately display "0.0" and "A02" or the alarm output automatically turns OFF, replace the Power Supply Unit within 6 months.
  - Separate the alarm output cables from power lines and high-voltage lines.
  - Do not apply a voltage or connect a load to the alarm output that exceeds the rated voltage or load.
  - Maintain an ambient storage temperature of -20 to 30°C and humidity of 25% to 70% when storing the product for longer than 3 months to keep the replacement notification function in optimum working condition.
  - Always use the standard installation method. A nonstandard installation will decrease heat dissipation, delay the replacement notification signal, and may degrade or damage the internal elements.
- Design the system so that the power supply capacity of the Power Supply Unit is not exceeded.

• Do not touch the terminals on the Power Supply Unit immediately after turning OFF the power supply. Electric shock may occur due to the residual voltage.

## 6 Conformance to EC Directives

### 6-1 Applicable Directives

- EMC Directives
- Low Voltage Directive

#### 6-2 Concepts

#### **EMC Directives**

OMRON devices that comply with EC Directives also conform to the related EMC standards so that they can be more easily built into other devices or the overall machine. The actual products have been checked for conformity to EMC standards (see the following note). Whether the products conform to the standards in the system used by the customer, however, must be checked by the customer.

EMC-related performance of the OMRON devices that comply with EC Directives will vary depending on the configuration, wiring, and other conditions of the equipment or control panel on which the OMRON devices are installed. The customer must, therefore, perform the final check to confirm that devices and the overall machine conform to EMC standards.

Note Applicable EMC (Electromagnetic Compatibility) standards are as follows:

EMS (Electromagnetic Susceptibility): EN61000-6-2 EMI (Electromagnetic Interference): EN61000-6-4 (Radiated emission: 10-m regulations)

#### Low Voltage Directives

Always ensure that devices operating at voltages of 50 to 1,000 V AC and 75 to 1,500 V DC meet the required safety standards for the PLC (EN61131-2).

### 6-3 Conformance to EC Directives

The CS/CJ-series PLCs comply with EC Directives. To ensure that the machine or device in which a CS/CJ-series PLC is used complies with EC Directives, the PLC must be installed as follows:

- The CS/CJ-series PLC must be installed within a control panel.
- You must use reinforced insulation or double insulation for the DC power supplies used for the communications power supply and I/O power supplies.
- CS/CJ-series PLCs complying with EC Directives also conform to the Common Emission Standard (EN61000-6-4). Radiated emission characteristics (10-m regulations) may vary depending on the configuration of the control panel used, other devices connected to the control panel, wiring, and other conditions. You must therefore confirm that the overall machine or equipment complies with EC Directives.

## 6-4 Conditions for Complying with EC Directives

The following condition was used in the immunity test of the CS1W-PTS11/ PTS12, PDC11, CJ1W-PTS15/PTS16, and CJ1W-PDC15 Analog I/O Units.

• Standard accuracy: ±5%

The following conditions were used in the immunity test of the CS1W-PTS51/ PTS52/PTS55/PTS56, PDC55 and CJ1W-PTS51/PTS52.

CS1W-PTS51 CS1W-PTS55	R or S thermocouple	$\pm1\%$ of PV or $\pm10^\circ\text{C},$ whichever is larger, $\pm1$ digit			
CJ1W-PTS51	K, J, T, or L thermo- couple	$\pm1\%$ of PV or $\pm4^\circ\text{C},$ whichever is larger, $\pm1$ digit			
CS1W-PTS52	$\pm$ 1% of PV or $\pm$ 2°C, whichever is larger, $\pm$ 1 digit				
CS1W-PTS56					
CJ1W-PTS52					
CS1W-PDC55	$\pm$ 1% of FS max.

Isolated- type Resis- tance Thermom- eter Input	CJ1W- PTS52	4 inputs		250 ms/ 4 inputs	All inputs are isolated.	Resistance ther- mometer: Pt100 (JIS, IEC), JPt100	<ul> <li>Process value alarm (with external alarm)</li> <li>Sensor error detection</li> <li>Alarm-ON delay</li> <li>Zero/span adjustment</li> </ul>
Unit (Pt100, JPt100)	CJ1W- PTS16	2 inputs	1/64000	10 ms/ 2 inputs	All inputs are isolated.	Resistance ther- mometer: Pt100 (JIS, IEC), JPt100, Pt50, Ni508.4	<ul> <li>Process value alarm (with external alarm)</li> <li>Alarm-ON delay</li> <li>Sensor error detection</li> <li>Zero/span adjustment</li> <li>External 24-VDC power supply</li> </ul>
Isolated- type Direct Current Input Unit	CJ1W- PDC15	2 inputs	1/64000	10 ms/ 2 inputs	All inputs are isolated.	<ul> <li>DC voltage 0 to 1.25 V, -1.25to+1.25 V, 0 to 5 V, 1 to 5 V, -5 to +5 V, 0 to 10 V, -10 to +10 V, ±10 V user set range</li> <li>DC current 0 to 20 mA 4 to 20 mA</li> </ul>	<ul> <li>Variable range setting</li> <li>Process value scaling</li> <li>Square root processing</li> <li>Mean value processing</li> <li>Rate-of-change calculation and alarm</li> <li>Alarm-ON delay</li> <li>Input error detection</li> <li>Adjustment period control</li> <li>Peak and bottom detection</li> <li>Top and valley detection</li> <li>Zero/span adjustment</li> <li>Integral value calculation</li> <li>External 24-VDC power supply</li> </ul>

## 1-2 Features and Functions

#### I/O Isolation

The Analog I/O Units listed below have isolation between inputs or outputs. Therefore sneak circuits do not occur between thermocouples or between the power supply's common voltage inputs, so there is no need to utilize a signal converter to prevent sneak circuits.

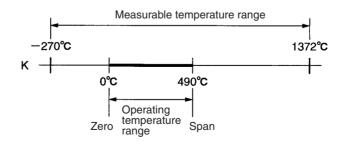

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Isolated-type Analog Output Units	CS1W-PMV01/PMV02

For the Analog I/O Units listed below, the input range can be set by the user according to the application. This function applies to the following Units:

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/12, CJ1W-PTS16
	Isolated-type Direct Current Input Units	CS1W-PDC01/11, CJ1W-PDC15

**Note** The accuracy and resolution of the CS1W-PTS01-V1, CS1W-PTS02, and CS1W-PDC01 are in respect to the internal ranges.

Process Value (or Instantaneous Value) Scaling in Industrial Units

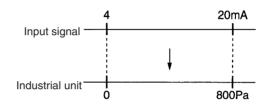

Variable Input Range

Setting

This function takes the value scaled in industrial units with respect to the input signal's zero point and span point, and transfers it to the CPU Unit as the process value (or instantaneous value). Because of this, no ladder program is required at the CPU Unit for scaling.

**Note** It also possible to set the process value scaling zero/span point in reverse to create an inverse relationship.

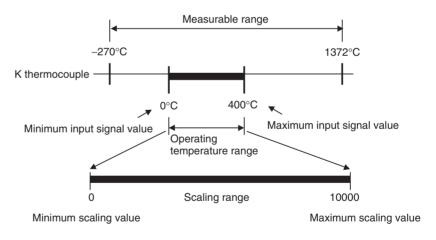

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12, CJ1W-PTS16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Unit	CS1W-PDC01/11/55, PTR02, CJ1W-PDC15
	Power Transducer Input Unit	CS1W-PTR01
	Isolated-type Pulse Input Unit	CS1W-PPS01

#### ■ CS1W-PTS11/12, PDC11, CJ1W-PTS15/16, PDC15

With the CS1W-PTS11/PTS12, PDC11, and CJ1W-PTS15/16, PDC15, the input range for thermocouple inputs, and platinum-resistance thermometer inputs, or the  $\pm$ 10-V user-set range for DC inputs can be set directly, and scaling can be set for the range in industrial units. This eliminates the need for processing scaling in the ladder program.

**Note** It also possible to set the process value scaling zero/span points in reverse to create an inverse relationship.

#### Process Value Alarm

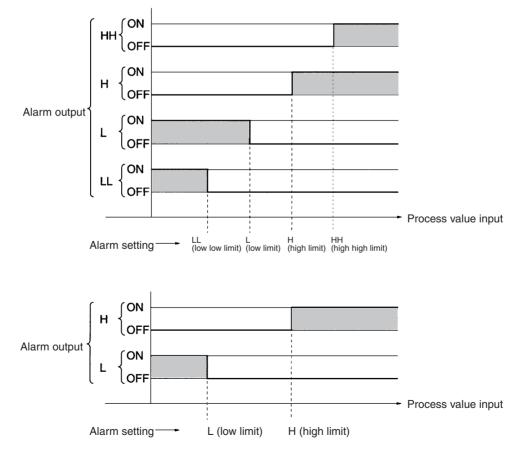

Either a 2-point alarm (H and L limits) or a 4-point alarm (HH, H, L, and LL limits) is possible for the process value (or instantaneous value).

Section 1-2

, ,	•	,	/
Applicable Units	4-point alarm	Isolated-type Ther- mocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
		Isolated-type Resis- tance Thermometer Input Units	CS1W-PTS02/03/12, CJ1W-PTS16
		Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
		Isolated-type Direct Current Input Units	CS1W-PDC01/11, PTR02, CJ1W-PDC15
		Isolated-type Pulse Input Unit	CS1W-PPS01
	2-point alarm	Isolated-type Ther- mocouple Input Units	CS1W-PTS51/55, CJ1W-PTS51
		Isolated-type Resis- tance Thermometer Input Units	CS1W-PTS52/56, CJ1W-PTS52
		Analog Input Unit (100 mV)	CS1WPTR02, CS1W-PDC55
		Power Transducer Input Unit	CS1W-PTR01

CS1W-PTS51/52 and CJ1W-PTS51/52 Units have one external alarm output for each input. High or low outputs can be selected.

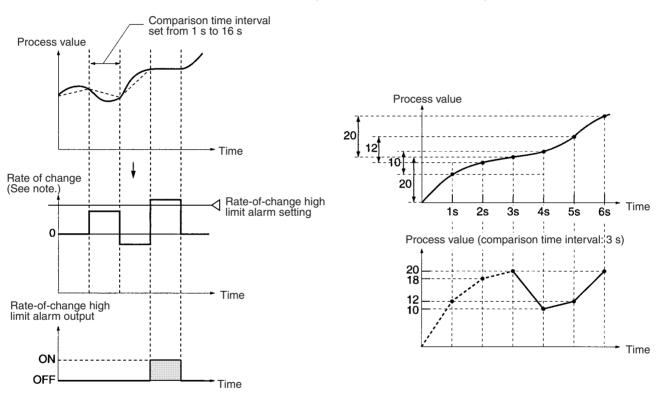

CS1W-PTS55/PTS56 and PDC55 output alarms to the Expansion Setting Area. This enables obtaining alarm outputs without special programming.

#### Rate-of-change Calculation and Alarm

The Analog I/O Units listed below calculate the rate of change for the process value, and output an alarm when the high or low limit is exceeded. The rateof-change value is derived by taking the difference each second between the process value at that time and the process value before the comparison time interval. The comparison time interval can be set from 1 to 16 seconds. This allows even a small process value rate of change to be detected.

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12, CJ1W-PTS16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11, CJ1W-PDC15

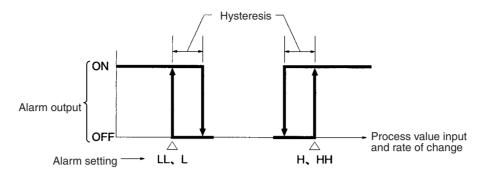

**Note** The rate of change is calculated every second (and not just once during the comparison time interval) so that even minute changes in the process value are detected.

#### **Alarm Hysteresis**

An hysteresis can be set for the process value (or instantaneous value) alarm and the rate-of-change alarm. The operation is as shown in the following diagram.

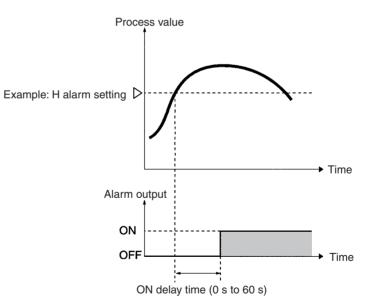

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, PTR02, CJ1W-PDC15
	Power Transducer Input Unit	CS1W-PTR01
	Isolated-type Pulse Input Unit	CS1W-PPS01

#### **Alarm-ON Delay**

This function can be used to set a given time period (0 s to 60 s) for delaying the turning ON of the alarm after the process value (or instantaneous value) alarm status or the alarm setting is reached. One alarm-ON delay is set for each input or output. The same setting is used for all process value alarms (HH, H, L, LL) and rate-of-change alarms (H, L).

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, PTR02, CJ1W-PDC15
	Power Transducer Input Unit	CS1W-PTR01
	Isolated-type Pulse Input Unit	CS1W-PPS01

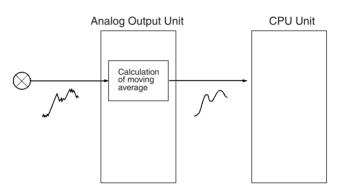

Mean Value Processing

The moving average of a specified number (from 1 to 16) of past process values (or instantaneous values) can be calculated and stored as the process value. An input noise filter can be installed if erroneous process values are obtained due to noise, or if the system has sudden voltage or current fluctuations.

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12, CJ1W-PTS16
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11, PTR02, CJ1W-PDC15
	Power Transducer Input Unit	CS1W-PTR01
	Isolated-type Pulse Input Unit	CS1W-PPS01

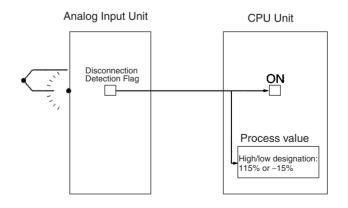

Note For the CS1W-PTR01 and CS1W-PTR02, four process values are always averaged. For the CS1W-PTS11, CS1W-PTS12, CS1W-PDC11, CJ1W-PTS15, CJ1W-PTS16, and CJ1W-PDC15 the number of values to be averaged can be set to between 1 and 128.

# Input Disconnection Detection

Sensor disconnections can be detected for thermocouple input and resistance thermometer input. Either the high (115%) or low (-15%) direction can be specified for when a disconnection is detected.

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12, CJ1W-PTS16

#### Input Error Detection

An errors resulting from exceeding the high or low limits can be detected.

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS51/55, CJ1W-PTS51
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS52/56, CJ1W-PTS52
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01-V1
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, CJ1W-PDC15

Note An input error will be detected for the CS1W-PTS5□ or CJ1W-PTS5□ if the input exceeds 20 digits for the high or low limits of the sensor range. For the CS1W-PDC55, an input error will be detected if the input exceeds -5% or +105% for the internal range full span.

**Cold Junction Sensor Errors Detection** If a Thermocouple Input Unit's cold junction sensor is disconnected, or if short-circuiting occurs, the Cold Junction Error Flag will turn ON and a temperature process value with no cold junction compensation will be stored in the CIO Area.

	51	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
--	----	--

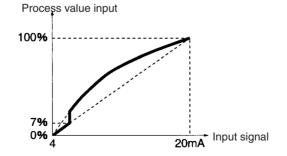

- Note 1. If one of the two cold junction sensors is disconnected as described above, cold junction compensation will be stopped for all inputs.
  - There is only one cold junction sensor for the CS1W-PTS51 and CJ1W-PTS51. There are two cold junction sensors for the CJ1W-PTS15.

**Square Root** For 2-wire transmitter input and analog input, this function takes as the process value the square root of the analog input value. It is used for operations such as calculating momentary flow based on the differential pressure input from a differential pressure transmitter.

With linear characteristics at an output of approximately 7% or less, an on-site differential pressure transmitter's zero-point adjustment can be performed with this function enabled.

**Note** The square root function is enabled only when the maximum scaling value is greater than the minimum scaling value. Square root extraction will not be possible if the minimum scaling value is greater.

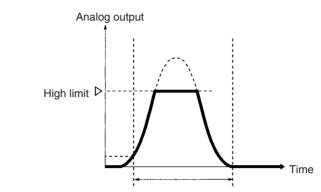

Applicable Units	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	51	CS1W-PDC01/11/55, CJ1W-PDC15

#### Inrush Input Limit

The inrush input limit function temporarily limits the process value input to a given set value when it increases from a low value (2%). This function is used for preventing a process value alarm from being generated by the inrush current, e.g., when the motor is started.

Applicable Units	Analog Input Unit (100 mA)	CS1W-PTR02
	Power Transducer Input Unit	CS1W-PTR01

Inrush high limit time: 0 s to 100 s

Zero/Span Adjustment

The zero point and span point can be adjusted for a process value (or instantaneous value). The zero adjustment offsets the line plotting values before and after adjustment parallel to the original line. The span adjustment changes the slope of the line (i.e., the gain) around the minimum value in the range (i.e., the minimum value is not changed). The zero adjustment value and the span adjustment gain are set in the DM Area words allocated in the CPU Unit. These settings are refreshed during operation, so the values can be adjusted under normal operating conditions.

Also, with the CS1W-PTS11/PTS12, CS1W-PDC11, and CJ1W-PTS15/PTS16, the zero point and span point can be adjusted for a specified point (position) other than 0% or 100%. The zero adjustment value and span adjustment gain for specified points are set in the Expansion Setting Area allocated to the Unit.

Refer to Appendix B Zero/Span Adjustment Example for details.

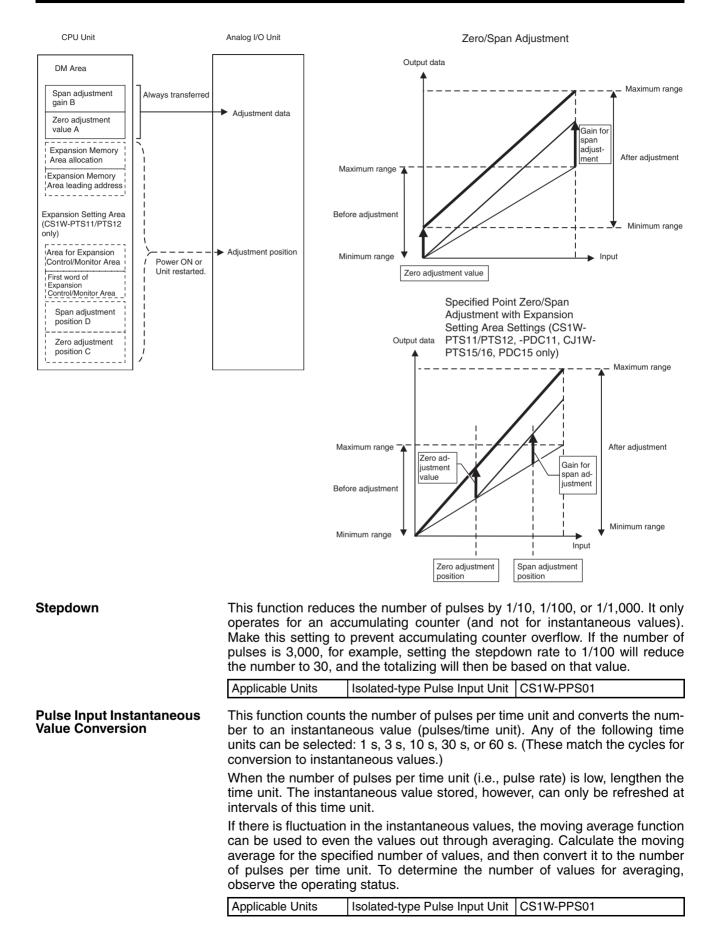

#### Zero/Span Adjustment Only

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52
	Isolated-type 2-Wire Transmit- ter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, PTR02
	Power Transducer Input Unit	CS1W-PTR01
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Isolated-type Analog Output Units	CS1W-PMV01/PMV02

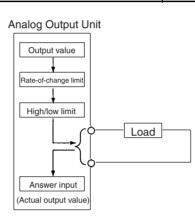

#### Zero/Span Adjustment and Zero/Span Adjustment for Specified Points

	Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS12, CJ1W-PTS16	
	Isolated-type Analog Input Unit	CS1W-PDC11, CJ1W-PDC15	

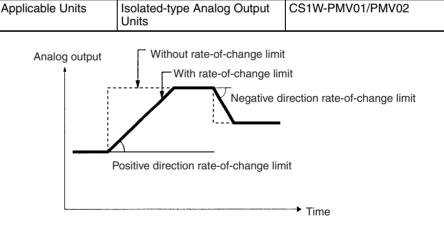

#### Features and Functions

**Pulse Accumulation** Pulse Input Units can accumulate pulses within a range of 0 to 9,999 (0000 to 270F hex). With each accumulation conversion period, the number of input pulses after the stepdown is added. If the accumulated value exceeds 9,999, pulses are accumulated again from 0000. When the PLC is turned ON or the Unit is restarted, the accumulated value is reset to 0 and the Accumulation Reset Bit turns ON for 10 seconds. Applicable Units Isolated-type Pulse Input Unit CS1W-PPS01 During analog output, the actual analog output (current or voltage) signal can **Answer Input** be checked by being read again from the analog output terminals. This function is used for checking for actual output load discrepancies due to external load resistance, or for checking actual analog signal values when an output rate-of-change limit is used. Applicable Units Isolated-type Analog Output CS1W-PMV01 Unit

With this function, the analog output value's rate of change can be limited separately for the positive and negative directions.

# Output Disconnection Detection

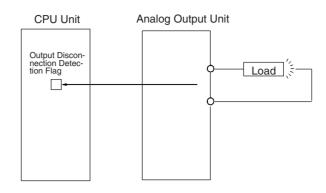

**Output Rate-of-change** 

Limİt

If a current loop is disconnected during analog output, this function will detect it.

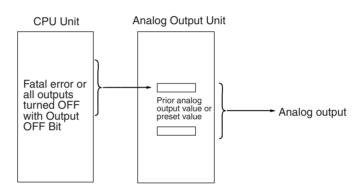

Applicable Units Isolated-type Analog Output Unit	CS1W-PMV01
--	------------

#### Features and Functions

Output Hold When CPU Unit Error Occurs When a fatal error (including user-defined FALS execution), or a CPU error in the CPU Unit occurs, or all outputs are turned OFF with the Output OFF Bit, this function can hold either a preset value or the analog output value prior to the error. When the CPU Unit is restored to normal operation, the output value in the CIO Area is output.

	Isolated-type Analog Output Units	CS1W-PMV01/PMV02
--	--------------------------------------	------------------

#### Adjustment Period Control

When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and the notice of days remaining have elapsed, this function turns ON a warning flag to give notice that it is time for readjustment.

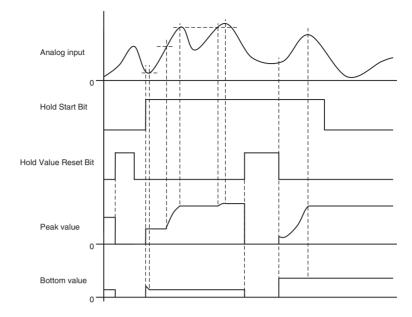

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS12, CJ1W-PTS16
	Isolated-type Analog Input Unit	CS1W-PDC11, CJ1W-PDC15

#### Peak and Bottom Detection

This function detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated in the Expansion Control/Monitor Area turns ON until it turns OFF. The peak and bottom values in the Expansion Control/Monitor Area are constantly refreshed, and they are cleared to zero while the Hold Value Reset Bit is ON.

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS12, CJ1W-PTS16
	Isolated-type Analog Input Unit	CS1W-PDC11, CJ1W-PDC15

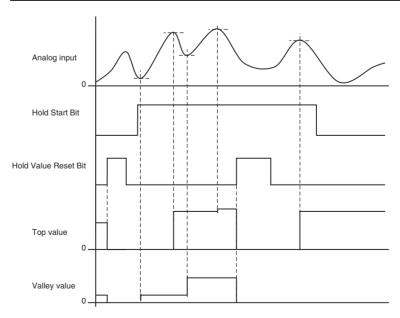

**Note** The top and valley detection function and the peak and bottom detection function cannot be used simultaneously.

**Top and Valley Detection** 

This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated in the Expansion Control/Monitor Area turns ON until it turns OFF. A detection hysteresis can be set so that minute changes are not detected. The top and valley values in the Expansion Control/Monitor Area are constantly refreshed, and they are cleared to zero while the Hold Value Reset Bit is ON.

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS12, CJ1W-PTS16
	Isolated-type Analog Input Unit	CS1W-PDC11, CJ1W-PDC15

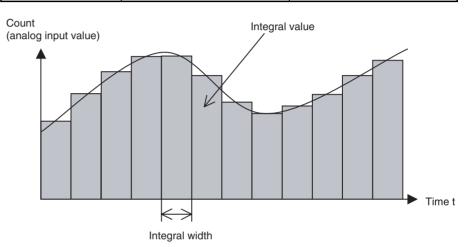

**Note** Either peak and bottom values or top and valley values can be selected for detection. This selection is made by using the Hold Function Selection Flag in

the Expansion Control/Monitor Area to select either the top and valley detection function or the peak and bottom detection function. These two functions cannot be used simultaneously.

Integral Value Calculation (CS1W-PDC11 and CJ1W-PDC15 Only) This function calculates the analog input value's time integral. The unit can be selected as either "hour" or "minute" by a setting in the Expansion Setting Area.

The integral value can be output to the Expansion Monitor/Control Area by turning ON the Integral Value Calculation Start Bit in the Expansion Monitor/Control Area. It can also be cleared to zero by turning ON the Integral Value Reset Bit in the Expansion Monitor/Control Area.

# 1-3 System Configuration

# **CS Series**

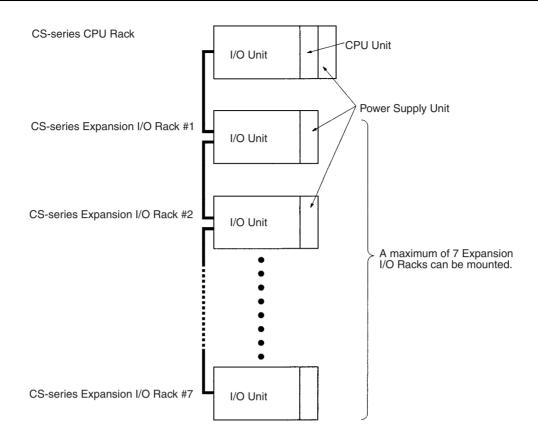

These Analog I/O Units belong to the CS-series Special I/O Unit group.

- They can be mounted to CS-series CPU Racks or Expansion I/O Racks.
- They cannot be mounted to C200H CPU Racks, Expansion I/O Racks, or SYSMAC BUS Remote I/O Slave Racks.

The number of Units that can be mounted to one Rack (either a CPU Rack or Expansion I/O Rack) depends upon the maximum current supplied by the Power Supply Unit and the current consumption by the other Units.

There are no restrictions on Rack position.

**Note** I/O addresses for Special I/O Units are allocated according to the unit number set on the switches on the front panel, and not according to the slot position in which they are mounted.

# **CJ** Series

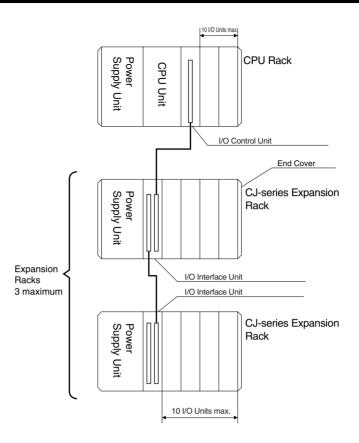

These Analog I/O Units belong to the CJ-series Special I/O Unit group.

• They can be mounted to CJ-series CPU Racks or Expansion I/O Racks.

The number of Units that can be mounted to one Rack (either a CPU Rack or Expansion I/O Rack) depends upon the maximum current supplied by the Power Supply Unit and the current consumption by the other Units.

There are no restrictions on Rack position.

Note I/O addresses for Special I/O Units are allocated according to the unit number set on the switches on the front panel, and not according to the slot position in which they are mounted.

# **1-4** Specifications and Installation

# 1-4-1 Specifications

# **CS Series**

The specifications shown in the following table apply to all the CS-series Analog I/O Units. For specifications and installation procedures specific to each Unit, refer to the explanations in *SECTION 2 Individual Unit Descriptions for CS Series*.

Item	Specification
Unit classification	CS-series Special I/O Unit
Structure	Backplane-mounted, single slot size
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
Weight	450 g max.

#### Unit Number Switches

The CPU Unit and Analog Input Unit exchange data via words allocated to the Analog Input Unit as a Special I/O Unit. Words are allocated to Special I/O Units in both the CIO Area and the DM Area.

The words that each Analog I/O Unit uses are determined by the setting of the unit number switches on the front panel of the Unit.

Unit No.	CIO Area addresses	DM Area addresses
0	CIO 2000 to CIO 2009	D20000 to D20099
1	CIO 2010 to CIO 2019	D20100 to D20199
2	CIO 2020 to CIO 2029	D20200 to D20299
3	CIO 2030 to CIO 2039	D20300 to D20399
4	CIO 2040 to CIO 2049	D20400 to D20499
5	CIO 2050 to CIO 2059	D20500 to D20599
6	CIO 2060 to CIO 2069	D20600 to D20699
7	CIO 2070 to CIO 2079	D20700 to D20799
8	CIO 2080 to CIO 2089	D20800 to D20899
9	CIO 2090 to CIO 2099	D20900 to D20999
10	CIO 2100 to CIO 2109	D21000 to D21099
to	to	to
n	CIO 2000 + n $\times$ 10 to CIO 2000 + n $\times$ 10 + 9	D20000 + n × 100 to D20000 + n × 100 + 99
to	to	to
95	CIO 2950 to CIO 2959	D29500 to D29599

Note If two or more Special I/O Units are assigned the same unit number, a "UNIT No. DPL ERR" error (in the Programming Console) will occur (A401.13 will turn ON) and the PLC will not operate.

to	to	to
95	CIO 2950 to CIO 2959	D29500 to D29599

**Note** If two or more Special I/O Units are assigned the same unit number, a "UNIT No. DPL ERR" error (in the Programming Console) will occur (A401.13 will turn ON) and the PLC will not operate.

# 1-4-3 Exchanging Data with the CPU Unit

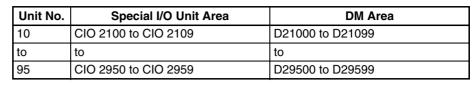

<u>CS1W-PTS01-V1,</u> <u>PTS02/03/51/52,</u> <u>PTW01, PDC01,</u> <u>PTR01/02, PMV01/02,</u> <u>CJ1W-PTS51/52</u>

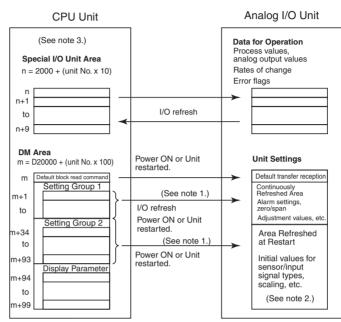

The Analog I/O Unit exchanges data with the CPU Unit via the allocated portions of the CPU Unit's Special I/O Unit Area and DM Area. The addresses allocated in these areas are determined as follows, according to the value (0 to 95) set by the unit number switch on the front panel of the Analog I/O Unit.

- Special I/O Unit Area: 10 words from beginning word n n = 2000 + unit number (0 to 95) x 10
- DM Area: 100 words from beginning word m
  - m = D20000 + unit number (0 to 95) x 100

The following table shows the addresses allocated according to the unit number.

Unit No.	Special I/O Unit Area	DM Area
0	CIO 2000 to CIO 2009	D20000 to D20099
1	CIO 2010 to CIO 2019	D20100 to D20199
2	CIO 2020 to CIO 2029	D20200 to D20299
3	CIO 2030 to CIO 2039	D20300 to D20399
4	CIO 2040 to CIO 2049	D20400 to D20499
5	CIO 2050 to CIO 2059	D20500 to D20599
6	CIO 2060 to CIO 2069	D20600 to D20699
7	CIO 2070 to CIO 2079	D20700 to D20799
8	CIO 2080 to CIO 2089	D20800 to D20899
9	CIO 2090 to CIO 2099	D20900 to D20999

- Note 1. This applies when word m contains other than 12345 (3039 hex), e.g., 0000 hex. When word m contains 12345 (3039 hex), the transfer direction will be reversed.
  - 2. The functions that can be used depend on the model.
  - 3. The allocated data areas depend on the model.

These areas have the following functions for Analog I/O Units.

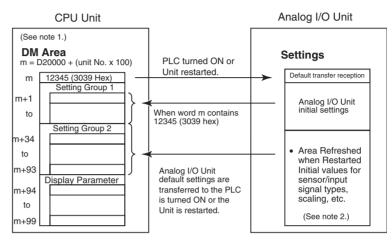

Special I/O	The data for operation is continuously refreshed.
Unit Area	The following types of data are transferred from Analog Input Units to the CPU Unit: Values scaled in industrial units for process values and rate-of-change values; alarm contact data, Input Disconnection Flag data, etc.
	Analog output values are transferred from the CPU Unit to Analog Output Units.

Data is set in this area. The allocated portion of the DM Area is divided into the four areas shown below.		
<b>Note</b> For details, refer to the explanations for the individual Units.		
1) Default block read command	When the PLC is turned ON or the Unit is restarted, the data in the Analog I/O Unit can be transferred back to the CPU Unit.	
	Beginning word m is fixed. When word m contains 12345 (3039 hex), then the data is transferred from the Analog I/O Unit to the CPU Unit.	
	When word m contains less than 12345 (3039 hex), such as 0 (0000 hex), then data is transferred from the CPU Unit to the Analog I/O Unit as usual.	
2) Setting Group 1 (continuously refreshed area)	While the PLC is ON (even if the CPU Unit is operating), this area is continuously refreshed.	
	This area is refreshed when the PLC is turned ON or the Unit is restarted.	
	The area is refreshed regardless of the CPU Unit's operation mode (i.e., RUN, Mon- itor, or Program Mode).	
	Alarm settings, zero/span adjustment val- ues, and so on, are set here.	
3) Setting Group 2 (initial settings area)	When word m contains anything other than 12345 (3039 hex), data is transferred once to this area from the CPU Unit when the PLC is turned ON or the Unit is restarted.	
	Sensor types, process value scaling, alarm supplementary functions, etc., are set here.	
4) Display Parameter	Data range error addresses are stored here. (See note.)	

Note

- 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Data Range Error Address in the DM Area in four digits hexadecimal. When an error is made in Setting Group 1, the ERR indicator will light and the data range error address will be stored immediately. When an error is made in Setting Group 2, the ERC indicator will light when the the PLC is turned ON again or the Unit is restarted and the data range error address will be stored at that time.
  - 2. The functions that can be used depend on the model.

Transferring Analog I/O Unit Default Settings to the CPU Unit When transferring the Analog I/O Unit's default settings to the CPU Unit's DM Area to be used for operation, store 12345 (3039 hex) in word m and either turn ON the power supply or restart the Unit. After the default settings have been transferred, the value in word m will be automatically returned to 0 (0000 hex). From that point onwards, the values stored in the DM Area will be transferred to the Analog I/O Unit for operation when the PLC is turned ON or the Unit is restarted.

Note

- 1. The allocated data areas depend on the model.
  - 2. The functions that can be used depend on the model.

#### Restarting Special I/O Units

CS1W-PTS11/12,

PDC11 and CJ1W-

PTS15/16, PDC15

To restore operation after the contents of the DM Area have been changed, or after the cause of an error has been cleared, either turn ON the power supply to the PLC or turn the Special I/O Unit Restart Bit ON and then OFF again.

Unit No.	DM Area allocation
0	A502.00
1	A502.01
to	to
15	A502.15
to	to
95	A507.15

**Note** If an error is not cleared when the PLC is turned ON again or the Special I/O Unit Restart Bit is turned ON and then OFF again, replace the Unit.

These Units exchange data with the following CPU Unit areas:

- DM Area words allocated to the Unit as a Special I/O Unit
- CIO Area words allocated to the Unit as a Special I/O Unit
- Expansion Setting Area
- Expansion Control/Monitor Area

Set the addresses for these areas as follows:

Area	Setting method
DM Area words allocated to the Unit as a Special I/O Unit	Set on the unit number switches (rotary switches) on the front of the Analog I/O
Data Area allocated to the Unit as a Special I/O Unit	Unit.
Expansion Setting Area	Set in words m+98 and m+99 in the DM Area.
Expansion Control/Monitor Area	Set in words o and o+1 in the Expan- sion Setting Area.

33

Expansion Area addresses are determined as follows, according to the settings.

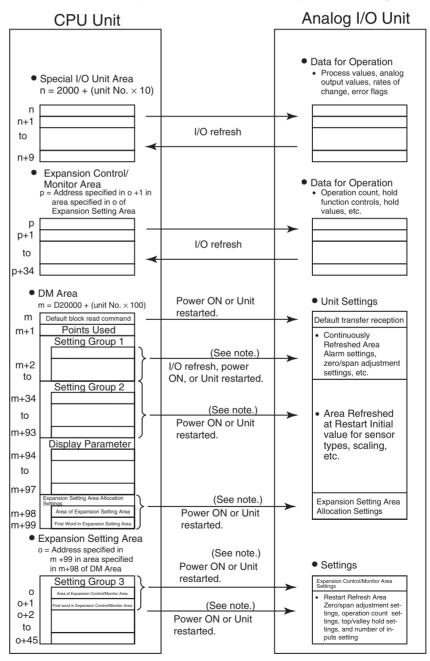

**DM Area** A total of 100 words beginning with first word, word m (m = D20000 + unit number (0 to 95) x 100).

**Special I/O Unit Area** A total of 10 words beginning with first word, word n (n = 2000 + unit number (0 to 95) x 100).

**Expansion Setting Area** A total of 46 words (See note.) beginning with first word, word o (o = Word specified in word m+99 in the area specified in word m+98 in the DM Area).

**Note** The expansion setting area for a CJ-series PLC is 24 words from word o to word o+23.

A total of 35 words beginning with first word, word p. (p = address specified in word o+1 in the area specified in word o in the Expansion Setting Area.

Expansion Control/Monitor Area

- Note 1. This applies when word m contains other than 12345 (3039 hex), e.g., 0000 hex. When word m contains12345 (3039 hex), the transfer direction will be reversed.
  - 2. The expansion setting area for a CJ-series PLC is 24 words from word o to word o+23.
  - 3. When specifying an expansion control/monitor area or an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
  - 4. When specifying the first word in an expansion control/monitor area or an expansion setting area, be sure that the end of the memory area is not exceeded.

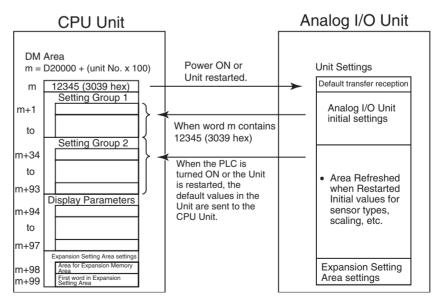

These areas have the following functions for Analog I/O Units.

Area
ual
, the to the
ata is t.
such PU
ting),
or the
opera-
o on,
Jnit
nen-
ote.)
Jnit as
I/O or pro- ata,
)

Expansion Setting Data for operation is continuously refreshed.		
Area	<b>Note</b> For details, refer to the explanations for the individual Units.	
	3) Setting Group 3 (initial settings area):	
	Data is transferred once to this area from the CPU Unit when the PLC is turned ON or the Unit is restarted, as long as word m contains other than 12345 and the Expansion Setting Area settings are allocated (i.e., word m+98 contains other than 0).	
	Expansion Control/Monitor Area settings, zero/span adjustment supplement, and so on, are set here.	
Expansion Con- trol/Monitor Area	Data for operation is continuously refreshed. Bits for begin- ning or resetting the hold function selection, adjustment period control, control bits, and so on, are transferred from the CPU Unit to the Analog Input Unit. Adjustment period notices, peak and bottom values, top and valley values, and so on, are transferred from the Analog Input Unit to the CPU Unit.	

**Note** The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Data Range Error Address in the DM Area in four digits hexadecimal. If the first word containing the out-of-range error is in the Expansion Setting Area, the Data Range Error Address offset will be 100 words or more (e.g., 100 words for an error in the first word in the Expansion Setting Area). When an error is made in Setting Group 1, the ERR indicator will light and the data range error address will be stored immediately. When an error is made in Setting Group 2, the ERC indicator will light when the the PLC is turned ON again or the Unit is restarted and the data range error address will be stored at that time.

When transferring the Analog I/O Unit's default settings to the CPU Unit's DM Area and Expansion Setting Area used for operation, store 12345 (3039 hex) in word m and either turn the power supply OFF and ON or restart the Unit. After the default settings have been transferred, the value in word m will be automatically returned to 0 (0000 hex). From that point onwards, the values stored in the DM Area will be transferred to the Analog I/O Unit for operation when the PLC is turned ON or when the Unit is restarted.

Transferring Analog I/O Unit Default Settings to the CPU Unit

36

# Restarting Special I/O Units

To restore operation after the contents of the DM Area have been changed, or after the cause of an error has been cleared, either turn ON the power supply to the PLC again or turn ON the Special I/O Unit Restart Bit ON.

Section 1-4

Unit No.	AR Area allocation
0	A502.00
1	A502.01
15	A502.15
95	A507.15

**Note** If an error is not cleared when the PLC is turned ON again or the Special I/O Unit Restart Bit is turned ON and then OFF again, replace the Unit.

### <u>CS1W-PTS55/56,</u> <u>PDC55</u>

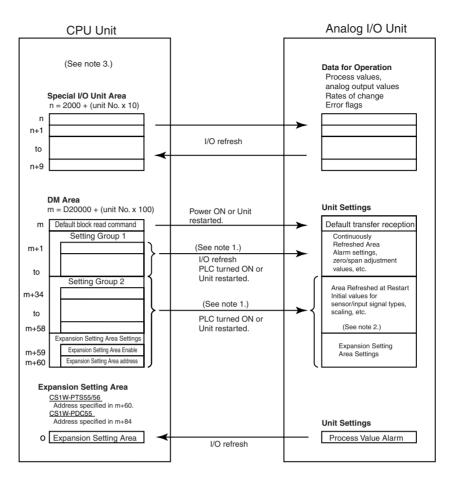

The Analog I/O Unit exchanges data with the CPU Unit via the allocated portions of the CPU Unit's Special I/O Unit Area and DM Area. The addresses allocated in these areas are determined as follows, according to the value (0 to 95) set by the unit number switch on the front panel of the Analog I/O Unit.

- Special I/O Unit Area: 10 words from beginning word n n = 2000 + unit number (0 to 95) x 10
- DM Area: 100 words from beginning word m m = D20000 + unit number (0 to 95) x 100
- Expansion Setting Area
  - CS1W-PTS55/PTS56 Address specified in word m+60 in the area specified in word o in the Expansion Setting Area (one word only).
  - CS1W-PDC55

Address specified in word m+84 in the area specified in word o in the Expansion Setting Area (one word only).

The following table shows the addresses allocated according to the unit number.

Unit No.	Special I/O Unit Area	DM Area
0	CIO 2000 to CIO 2009	D20000 to D20099
1	CIO 2010 to CIO 2019	D20100 to D20199
2	CIO 2020 to CIO 2029	D20200 to D20299
3	CIO 2030 to CIO 2039	D20300 to D20399
4	CIO 2040 to CIO 2049	D20400 to D20499
5	CIO 2050 to CIO 2059	D20500 to D20599
6	CIO 2060 to CIO 2069	D20600 to D20699
7	CIO 2070 to CIO 2079	D20700 to D20799
8	CIO 2080 to CIO 2089	D20800 to D20899
9	CIO 2090 to CIO 2099	D20900 to D20999
10	CIO 2100 to CIO 2109	D21000 to D21099
to	to	to
95	CIO 2950 to CIO 2959	D29500 to D29599

- Note 1. This applies when word m contains other than 12345 (3039 hex), e.g., 0000 hex. When word m contains 12345 (3039 hex), the transfer direction will be reversed.
  - 2. The functions that can be used depend on the model.
  - 3. The allocated data areas depend on the model.

These areas have the following functions for Analog I/O Units.

	The data for operation is continuously refreshed.
Unit Area	The following types of data are transferred from Analog Input Units to the CPU Unit: Values scaled in industrial units for process values and rate-of-change values; alarm contact data, Input Disconnection Flag data, etc.
	Analog output values are transferred from the CPU Unit to Analog Output Units.

	Data is set in this area. The allocated portion of the DM Area is divided into the four areas shown below.						
N	Note For details, refer to the explanations for the individual Units.						
	1) Default block read command	When the PLC is turned ON or the Unit is restarted, the data in the Analog I/O Unit can be transferred back to the CPU Unit.					
		Beginning word m is fixed. When word m contains 12345 (3039 hex), then the data is transferred from the Analog I/O Unit to the CPU Unit.					
		When word m contains less than 12345 (3039 hex), such as 0 (0000 hex), then data is transferred from the CPU Unit to the Analog I/O Unit as usual.					
	2) Setting Group 1 (continuously refreshed area)	While the PLC is ON (even if the CPU Unit is operating), this area is continuously refreshed.					
		This area is refreshed when the PLC is turned ON or the Unit is restarted.					
		The area is refreshed regardless of the CPU Unit's operation mode (i.e., RUN, Moritor, or Program Mode).					
		Alarm settings, zero/span adjustment values, and so on, are set here.					
	3) Setting Group 2 (initial settings area)	When word m contains anything other than 12345 (3039 hex), data is transferred once to this area from the CPU Unit when the PLC is turned ON or the Unit is restarted.					
		Sensor types, process value scaling, alarm supplementary functions, etc., are set here					
	4) Display Parameter	Data range error addresses are stored here. (See note.)					
Expansion Setting Area	Data for operation is continuously refreshed. Process Value Alarm						

- **Note** 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Data Range Error Address in the DM Area in four digits hexadecimal. When an error is made in Setting Group 1, the ERR indicator will light and the data range error address will be stored immediately. When an error is made in Setting Group 2, the ERC indicator will light when the PLC is turned ON again or the Unit is restarted and the data range error address will be stored at that time.
  - 2. The functions that can be used depend on the model.

## Section 1-4

Transferring Analog I/O Unit Default Settings to the CPU Unit When transferring the Analog I/O Unit's default settings to the CPU Unit's DM Area to be used for operation, store 12345 (3039 hex) in word m and either turn the power supply OFF and ON or restart the Unit. After the default settings have been transferred, the value in word m will be automatically returned to 0 (0000 hex). From that point onwards, the values stored in the DM Area will be transferred to the Analog I/O Unit for operation when the PLC is turned ON or the Unit is restarted.

#### Note

1. The allocated data areas depend on the model.

2. The functions that can be used depend on the model.

To restore operation after the contents of the DM Area have been changed, or after the cause of an error has been cleared, either turn ON the power supply to the PLC or turn the Special I/O Unit Restart Bit ON and then OFF again.

Unit No.	DM Area allocation
0	A502.00
1	A502.01
to	to
15	A502.15
to	to
95	A507.15

**Note** If an error is not cleared when the PLC is turned ON again or the Special I/O Unit Restart Bit is turned ON and then OFF again, replace the Unit.

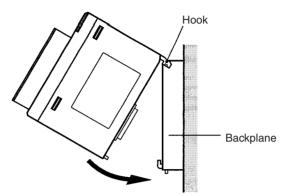

#### Restarting Special I/O Units

# 1-4-4 Mounting the Units

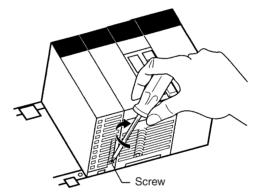

## **CS Series**

Use the following procedure to mount the CS-Series Analog I/O Unit to the Backplane.

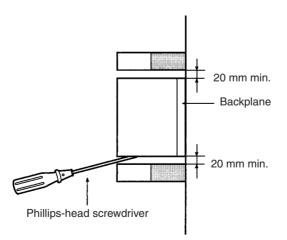

*1,2,3...* 1. Mount the Unit to the Backplane by attaching it with the top and bottom hooks.

- 2. Properly insert each Unit into the Backplane connector, and tighten the screws on the bottom of the Unit to a torque of 0.4 N•m.
- 3. To remove a Unit, loosen the screws and lift it off.

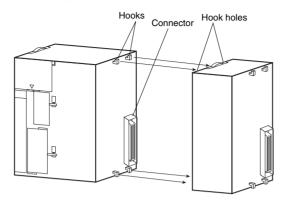

**Note** To allow for mounting and removal of Units, leave at least 20 mm of space between Units, as shown in the following diagram.

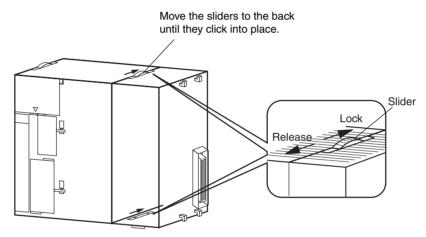

## **CJ Series**

Use the following procedure to connect Analog I/O Units to a CJ-series Rack.

*1,2,3...* 1. Align the connectors and press in firmly on the Units to connect them completely.

2. Move the sliders on the top and bottom of the Unit to the lock position to secure the Units. The sliders should click into place.

- 3. Attach an End Cover to the Unit on the right end of the Rack.
- **Note** The CJ-series PLC may not operate properly if the sliders are not locked firmly into place.

# **1-4-5** Precautions when Handling Units

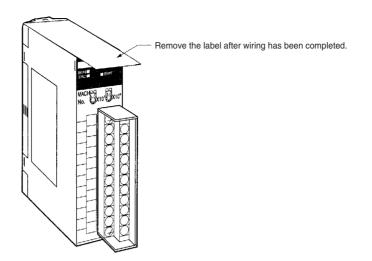

# CS Series

Turn OFF the power to the PLC before mounting or removing Units, or connecting or disconnecting wiring.

To prevent adverse effects from noise, place I/O wiring in separate ducts from high-voltage or power lines.

Always ground the GR terminal on the Power Supply Unit of the PLC.

When wiring, leave the label on the Unit's top panel in place to prevent foreign objects such as wire clippings from dropping into the Unit. The label must be removed after wiring or the Unit will overheat.

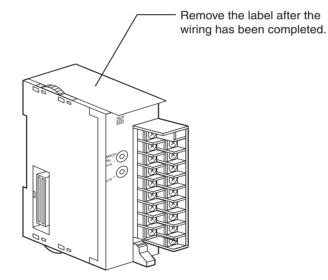

# **CJ Series**

Be sure to turn OFF the power supply to the PLC before installing or disconnecting Units or connecting lines.

To reduce the risk of malfunctioning due to electrical noise, wire input and output lines in separate ducts from high-voltage and power lines.

When wiring a Unit, place a label over the top of the Unit to prevent wire clippings or other materials from getting inside the Unit. When the wiring has been completed, the label must be removed to prevent heat radiation.

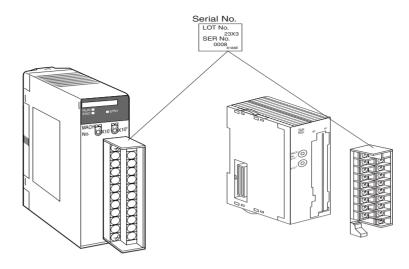

#### Precautions in Handling Removable Terminal Blocks

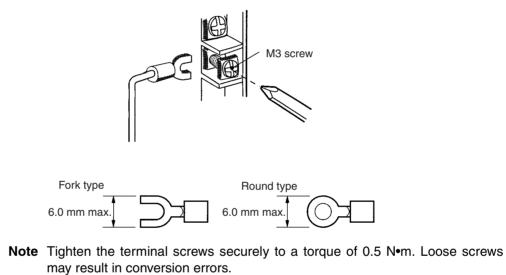

- The terminal block is removable. Press the lever on the bottom of the terminal block to remove the terminal block.
- During normal use, check that the lever is raised and the terminal block is locked in place.

Note Precautions for Terminal Blocks on Thermocouple Input Units

- Thermocouple Input Units have cold junction compensation. Indication accuracy will be as specified only when the cold junction compensator (i.e., the terminal block) and the Unit are used as a set. Always use the CS1W-PTS51/CJ1W-PTS51 Unit and its terminal block as a set. Both the CS1W-PTS51/CJ1W-PTS51 Unit and the terminal block have labels on them providing the serial number.
- If repairs are required to the Unit, always return the terminal block (including the cold junction compensator) with the Unit.

Terminal Block Dimensions

# **Operating Procedures**

# **CJ Series**

# 1-5 Operating Procedures

Use the following procedures to operate the Analog I/O Unit. The procedures are the same for all models.

### Initial Setup (Hardware)

*1,2,3...* 1. Set the unit number, using the rotary switches on the front panel of the Unit.

- Mount the Unit to either a CPU Rack or Expansion Rack. A maximum of 80 Units for the CS Series and 40 Units for the CJ Series can be mounted in a basic System (with no restrictions on mounting location).
- 3. Connect sensors or external control units.
- 4. Connect a Programming Device to the PLC.
- 5. Turn ON the power to the PLC.
- 6. Create the I/O tables.
- 7. Allow time for warmup (see note).

Note Analog I/O Units require time to warm up after the PLC is turned ON. Warmup times differ for each Unit, as shown in the following table.

Model	Warmup time
CS1W-PTS01-V1/11, CJ1W-PTS15	45 min
CS1W-PTS5□, CJ1W-PTS5□	30 min
Other Analog I/O Units	10 min

#### Initial Software Setup

1,2,3...

1. Make the initial settings in the DM Area (m to m+99).

• When using the Unit's default values, set word m to 12345 (3039 hex).

- When using data from the CPU Unit's DM Area, set word m to a value other than 12345 (3039 hex), such as 0000 hex.
- 2. Turn the power OFF and then back ON again, or turn ON the Special I/O Unit Restart Bit.

#### Ladder Diagram Program

Name	Model	Basic ladder diagram programming
Isolated-type Thermo- couple Input Unit	CS1W-PTS01- V1 CS1W- PTS11/51 CS1W-PTS55 CJ1W-PTS51/ 15	Reading the converted value using MOV(021) with the Input Disconnection Flag's NC condition as the input condition. # **1-6 Error Processing**

The following table shows the contents of the LED indicator displays on the front panel of the Analog I/O Unit. The contents shown here are the same for all models. For error processing specific to each Unit, refer to the explanations for the individual Units.

### Errors Detected by the Analog I/O Unit

ERC LED (red)	RUN LED (green)	Contents	Probable cause	Unit operation	Remedy
Lit	Lit	Setting Group 1 (con- tinuously refreshed area) error (See note 1.)	The Analog I/O Unit started up and was operating properly, but an out-of-range setting was made in Setting Group 1 in the DM Area.	The Unit continues operating with the Setting Group 1 data prior to the change.	Restore the set value to within the allowable range. (There is no need to turn the power supply OFF and ON or to restart the Unit.)
	Not lit	Setting Group 1 (See note 1.), Setting Group 2 (See note 2.) error, or Expansion Setting Area (See note 3.)	An out-of-range set- ting was made for either Setting Group 1 or Setting Group 2 in the DM Area.	The Unit will not start up.	Restore the set value to within the allowable range, and then either turn the power sup- ply OFF and ON or restart the Unit.

Note	1.	The following table shows the processing and results for Setting Grou	up 1.
11010		The following able brieffe are proceeding and recard for bearing area	<b>A</b> P 1.

Processing	Result	LED indicators on Unit	Data range error address stored in DM Area
When an out-of- range setting is made in Setting Group 1 during operation	The Unit continues to operate with the Setting Group 1 data prior to the change.	ERC indicator is lit. RUN indicator remains lit.	The lowest DM address where the out-of-range error occurred is stored, in four digits hexa- decimal, as the off- set value from m (i.e., the number of added words).
$\downarrow$			
When the setting is changed within the allowable range during operation	The Unit operates with the Setting Group 1 data after the change.	ERC indicator is not lit. RUN indicator remains lit.	If there is no other error, 0000 hex is stored. (If there is another error, the offset value for that DM address is stored.)
When the the PLC is turned ON or the Unit is restarted with an error still in effect.	The Unit will not start up.	ERC indicator is lit. RUN indicator is not lit.	The lowest DM address where the out-of-range error occurred is stored, in four digits hexa- decimal, as the off- set value from m (i.e., the number of added words).
$\downarrow$			
When the setting is made within the allowable range, and the PLC is turned ON or the Unit is restarted	The Unit starts up normally.	ERC indicator is not lit. RUN indicator is lit.	If there is no other error, 0000 hex is stored. (If there is another error, the offset value for that DM address is stored.)

Processing	Result	LED indicators on Unit	Data range error address stored in DM Area
When an out-of- range setting is made in Setting Group 2 during operation	The Unit operates with the Setting Group 2 data prior to the change.	ERC indicator is not lit. RUN indicator remains lit.	If there is no other setting error, 0000 hex remains stored. (If there is another setting error, the offset value for that DM address is stored.)
$\downarrow$			
When the PLC is turned ON or when the Unit is restarted	The Unit will not start up.	ERC indicator is lit. RUN indicator is not lit.	The lowest DM address where the out-of-range error occurred is stored, in four digits hexa- decimal, as the off- set value from m (i.e., the number of added words).
$\downarrow$			
When the setting is made within the allowable range, and the PLC is turned ON or the Unit is restarted	The Unit starts up normally.	ERC indicator is not lit. RUN indicator is lit.	If there is no other error, 0000 hex is stored. (If there is another error, the offset value for that DM address is stored.)

2. The following table shows the processing and results for Setting Group 2.

#### Errors Related to the CPU Unit

The ERH indicator will be lit red for all of the following errors.

ERH LED	RUN LED	Contents	Probable cause	Error type	Detailed cause	Input Unit status	Output Unit status	Remedy
(red) Lit	. , ,	Error in data exchange with the CPU Unit	During nor- mal opera- tion, an I/O bus error, CPU Unit monitoring error, or WDT error occurred at	I/O bus error	A data trans- mission error occurred between the CPU Unit and the Analog I/O Unit.	(See note 1.) Converted data becomes 0000 hex. External alarm output: No output. (See note 3.)	(See note 2.) Depending on the output hold status, either the set values prior to the error or preset val- ues will be held.	Turn OFF the power supply and check the installation con- ditions and the cable connec- tions between devices. Then turn the power
		the CPU Unit.	CPU Unit monitoring error	The CPU Unit did not respond within a fixed period of time.	Maintains the status exist- ing before the error. External alarm output: Output. (See note 3.)	Held at status existing before the error.	back ON.	
				CPU Unit WDT error	WDT error has been generated at CPU Unit.	Changes to undefined state. External alarm output: No output. (See note 3.)	Depending on the output hold status, either the set values prior to the error or preset val- ues will be held.	In PROGRAM Mode, turn the power OFF and then back ON.
	Not lit	Error in Analog I/O Unit's unit number or mounting	Either the unit num- ber is set incorrectly or the Unit is mounted incorrectly.	Duplicate Unit Number	The same unit number has been assigned to more than one Unit or the unit num- ber was set to a value other than 00 to 95.	Conversion does not start. External alarm output: No output. (See note 3.)	0 mA or 0 V will be output.	Reset the unit number so that it will not duplicate any other.
				Special I/O Unit Setting Error	The Analog I/O Units reg- istered in the I/O table are different from the ones actually mounted.			Check the mounting posi- tions, and either mount the Units according to the I/O table or cor- rect the I/O table.
		Fatal error a ply	t CPU Unit aft	er turning ON t	the power sup-			Take measures for CPU fatal error.

**Note** 1. Applicable Units:

CS1W-PTS01-V1/PTS11/PTS51/PTS55 and CJ1W-PTS51/15 Isolatedtype Thermocouple Input Units CS1W-PTS02/PTS03/PTS12/PTS52/PTS56 and CJ1W-PTS52/16 Isolated-type Resistance Thermometer Input Units CS1W-PTW01 Isolated-type 2-Wire Transmitter Input Unit CS1W-PDC01/PDC11/PDC55, PTR02, and CJ1W-PDC15 Isolated-type Direct Current Input Units CS1W-PTR01 Power Transducer Input Unit CS1W-PTR02 Analog Input Unit (100 mV) CS1W-PPS01 Isolated-type Pulse Input Unit.

- 2. Applicable Unit: CS1W-PMV01 Isolated-type Analog Output Unit.
- 3. Indicates the external alarm output status for CS1W-PTS51/PTS52 and CJ1W-PTS51/PTS52. The alarm outputs will operate normally even if all loads are turned OFF from the CPU Unit.
- 4. If either of the following changes is made for the Expansion Setting Area for the CS1W-PTS55/PTS56/PDC55, the previous data will be left in the Expansion Setting Area even after the change has been made. Clear the previous data when changing either of these settings.
  - The Expansion Setting Area Enable setting is changed from "enabled" to "disabled."
  - The Expansion Setting Area Address setting is changed while the Expansion Setting Area Enable setting is set to "enabled."

# 1-7 Specification Changes

# 1-7-1 CS1W-PTS01-V1, CS1W-PTS02/PTS03, CS1W-PTW01, CS1W-PDC01, CS1W-PPS01, CS1W-PMV01

The specifications of the following I/O Units with the lot number 000426 XXXX or later (manufactured since April 26, 2000) have been changed as shown in the table below.

# **Overview**

Name	Model	Main changes
Isolated-type Thermocouple Input Unit	CS1W-PTS01- V1	Improved effective resolution: From the equivalent of 10     bits to 1/4,096
		• Improved rate-of-change calculation: Refer to Improve- ment in Rate-of-change Calculation Method below for details.
Isolated-type Resistance Thermometer Input Unit	CS1W-PTS02	<ul> <li>Improved effective resolution: From the equivalent of 10 bits to 1/4,096</li> </ul>
		• Improved rate-of-change calculation: Refer to Improve- ment in Rate-of-change Calculation Method below for details.
Isolated-type Resistance Thermometer Input Unit (Ni508.4 $\Omega$ )	CS1W-PTS03	<ul> <li>Improved effective resolution: From the equivalent of 11 bits to 1/4,096</li> </ul>
		• Improved rate-of-change calculation: Refer to Improve- ment in Rate-of-change Calculation Method below for details.
Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01	Improved effective resolution: From the equivalent of 10     bits to 1/4,096
		• Improved rate-of-change calculation: Refer to Improve- ment in Rate-of-change Calculation Method below for details.
		Reduced 26-V consumption current: 0.4 A to 0.16 A
Isolated-type Direct Current Input Unit	CS1W-PDC01	Improved effective resolution: From the equivalent of 10     bits to 1/4,096
		• Improved rate-of-change calculation: Refer to Improve- ment in Rate-of-change Calculation Method below for details.
		• Added input range: 0 to 20 mA (Refer to <i>New Input Range (0 to 20 mA) for the CS1W-PDC01</i> for details.)

Name	Model	Main changes
Isolated-type Pulse Input Unit	CS1W-PPS01	• Changed instantaneous value setting method and added time unit setting function (Refer to <i>Instantaneous Value Measurement and Measurement Time Unit Setting for CS1W-PPS01</i> for details.)
		<ul> <li>Reduction of 26 V consumption current: 0.22 A to 0.16 A</li> </ul>
Isolated-type Analog Output Unit	CS1W-PMV01	<ul> <li>Improved resolution (answer back input): From the equiva- lent of 9 bits to 1/2000</li> </ul>

# **Details**

#### Improvement in Rate-of-change Calculation Method

#### Before Change

The current process value was compared with the value before the time set by the comparison time interval and the difference between them was divided by the comparison time interval to find the rate-of-change per second. When the difference was small, the calculated value turned out to be so small that it was hard to identify the change.

#### After Change

The current process value is compared with the value before the time set by the comparison time interval and the difference is output. When the difference is small, the comparison time interval can be set longer so that the change can be easily identified.

#### New Input Range (0 to 20 mA) for the CS1W-PDC01

#### Before Change

-10 to 10 V, 0 to 10 V, -5 to 5 V, 0 to 5 V, 1 to 5 V, 4 to 20 mA, user-set voltages

#### After Change

-10 to 10 V, 0 to 10 V, -5 to 5 V, 0 to 5 V, 1 to 5 V, 4 to 20 mA, user-set voltages, 0 to 20 mA (new)

The settings are shown below. (There is no need to change the setting unless the new setting is going to be used.)

• Before Change (m = D20000 + Unit number x 100)

	Of	fset		Setting	Setting name	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	range		
m+34	m+48	m+62	m+76	0 to 6	Input signal 0: -10 to +10 V, 1: 0 to 10 V, 2: -5 to 5 V, 3: 0 to 5 V, 4: 1 to 5 V, 5: 4 to 20 mA, 6: User-set voltages	

•	After Change	(m =	D20000 +	Unit number x 100	)
---	--------------	------	----------	-------------------	---

	Of	set		Setting	Setting name	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	range		
m+34	m+48	m+62	m+76	0 to 7	Input signal 0: -10 to +10 V, 1: 0 to 10 V, 2: -5 to 5 V, 3: 0 to 5 V, 4: 1 to 5 V, 5: 4 to 20 mA, 6: User-set voltages 7: 0 to 20 mA	

#### Instantaneous Value Measurement and Measurement Time Unit Setting for CS1W-PPS01

#### Instantaneous Value Measurement

#### **Before Change**

The number of pulses per second was output as an instantaneous value. To calculate the value, the number of pulses per 0.1 second was multiplied by 10. For pulses less than 10 Hz, 10 pulses/second and 0 pulses/second were alternately output due to inaccurate calculations.

#### After Change

The number of pulses per second is counted for that one second and output as is. This allows calculation of pulses down to 1 Hz.

#### Measurement Time Unit Setting

This new function allows setting of measurement time unit to enable measuring pulses with much slower frequencies. Measurement time unit can be set to 1, 3, 10, 30, or 60 s.

The settings are shown below. (There is no need to change the setting if the current unit of 1 s is going to be used.)

• Before Change (m = D20000 + Unit number x 100)

	Of	iset		Setting	Setting name	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	range		
m+30	m+38	8 m+46 m+54		Bits 00 to 03: 0 to 3	Decimal point position from right of instanta- neous value conversion coefficient	
				Bits 04 to 15: 0	Not used	

• After Change (m = D20000 + Unit number x 100)

	Off	iset		Setting	Setting name
Input No. 1	Input No. 2	Input No. 3	Input No. 4	range	
m+30	m+38	m+46	m+54	Bits 00 to 03: 0 to 3	Decimal point from right of instantaneous value conversion coefficient
				Bits 04 to 07: 0 to 4	Instantaneous value time unit
					0: 1 s 1: 3 s 2: 10 s 3: 30 s 4: 60 s
				Bits 08 to 15: 0	Not used

# 1-7-2 CS1W-PTS51/PTS52, CJ1W-PTS51/PTS52

The specifications of the following I/O Units with the lot number XX84 or later (manufactured since August 2004) have been changed as shown in the table below.

Model	Name	Main changes
CS1W- PTS51/PTS52	Isolated-type Thermocouple Input Units	<ul> <li>Added setting for selecting the span adjustment resolution for</li> </ul>
CJ1W- PTS51/PTS52		the zero/span adjustment func- tion. Before change: Resolution of 1/1,000 After change: Resolution of 1/1,000 or 1/10,000 selectable

#### CS1W-PTS51/PTS52

• Before Change (m = D20000 + Unit number × 100)

	DM ac	ldress		Data range		Default value	Data name
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
							Span adjust- ment
m+4	m+8	m+12	m+16	0 to 9999	0000 to 270F hex	1000 (03EB hex)	Set value × 0.001

### • After Change (m = D20000 + Unit number $\times$ 100)

	DM ac	ldress		Data	Data range		Data name
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
							Span adjust- ment
m+4	m+8	m+12	m+16	0 to 9999	0000 to 270F hex	1000 (03EB hex)	m+35 contains 0: Set value × 0.001
				0 to 32000	0000 to 7D00 hex	10000 (2710 hex)	m+35 contains 1: Set value × 0.0001
							Span adjust- ment mode setting
m+35	m+35				0000, 0001 hex	1 (See note.)	0: 1/1,000 1: 1/10,000

Note	Indicates the value after transferring the default values (set when 12345 is written to word m).
/DT050	Optimized and the second option the OOd mendels, success the the optimized and optized and optimized and optized and optimized and optimized a

CJ1W-PTS51/PTS52

Settings are the same as for the CS1 models, except that the address m+35 becomes m+32.

# SECTION 2 Individual Unit Descriptions for CS Series

This section describes each of the CS-series Analog I/O Units in detail.

2-1	CS1W-PTS01-V1 Isolated-type Thermocouple Input Unit	58
2-2	CS1W-PTS11 Isolated-type Thermocouple Input Unit	70
2-3	CS1W-PTS51 Isolated-type Thermocouple Input Unit	87
2-4	CS1W-PTS55 Isolated-type Thermocouple Input Unit	99
2-5	CS1W-PTS02 Isolated-type Resistance Thermometer Input Unit (Pt100 or JPt100)	111

# 2-1 CS1W-PTS01-V1 Isolated-type Thermocouple Input Unit

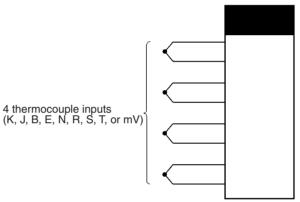

#### **Overview**

The CS1W-PTS01-V1 Isolated-type Thermocouple Input Unit provides four direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

# System Configuration

CS1W-PTS01-V1

#### **Features**

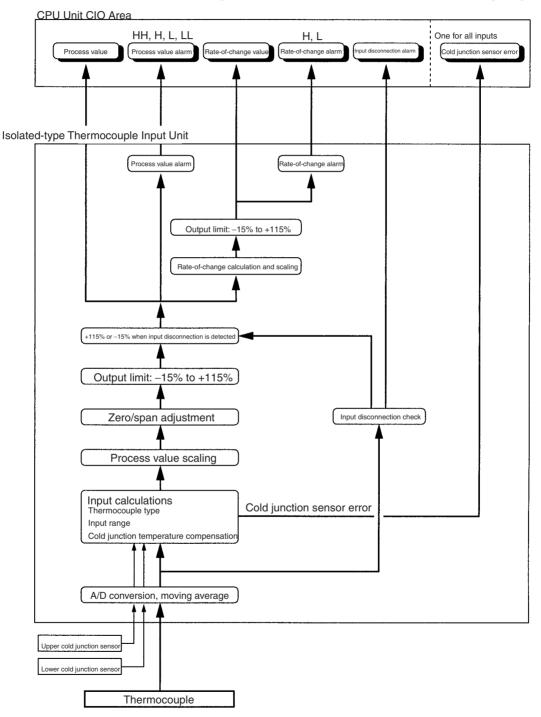

- Up to four thermocouples can be directly connected to each Unit (with four separate settings for temperature sensors and input ranges).
- Isolation between inputs prevents sneak circuits from occurring between thermocouple inputs.
- This Unit is suitable for a wide range of temperature specifications. K, J, B, E, N, R, S, or T can be selected.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- Maximum or minimum process value can be specified for when a disconnection is detected.

#### **Model Information**

Unit classification	Model number	Inputs	Temperature sensor types
CS-series Special I/O Unit	CS1W-PTS01-V1	4	Thermocouple K, J, B, E, N, R, S, T, or mV.

## Block Diagram (Order of Processing)

The processing for the four inputs is as shown in the following diagram.

# **Specifications**

Item		Specifications				
Model number		CS1W-PTS01-V1				
Applicable PLC		CS Series				
Unit classification		CS-series Special I/O Unit				
Mounting position	on	CS-series CPU Rack or CS-series Expans Expansion I/O Rack or SYSMAC BUS Ren	sion Rack (Cannot be mounted to C200H mote I/O Slave Rack.)			
Maximum numb	er of Units	80 (within the allowable current consumpti	on and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Un	it numbers.)			
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Thermocouple Input Unit to CPU Unit: All process values, process value alarms ( of-change alarms (L, H), disconnection ala	(LL, L, H, HH), rate-of-change values, rate- arms, cold junction sensor errors			
	DM Area words allocated to Spe- cial I/O Units	100 words/Unit CPU Unit to Thermocouple Input Unit: Temperature sensor type, input range (use stored in allocated words in CIO area, nun value alarm setting (LL, L, H, HH), rate-of- adjustment value, etc.				
Number of temp inputs	perature sensor	4				
Temperature sensor types		Thermocouple B, E, J, K, N, R, S, T or -80 to 80 mV. (Set separately for each of four inputs.)	Sensor type, input range, and scaling to industrial units are separate for each of the 4 inputs. Note Sensor type, input range, and scal- ing to industrial units are set in the DM Area.			
Input ranges		<ul> <li>The input range can be set within any of the measurable input ranges shown in Table 1 (below).</li> <li>Note Internally, inputs are processed in five ranges (refer to Table 2 below), so accuracy and resolution accord with these internal ranges.</li> </ul>	Example: Thermocouple: K; input range: 0 to 500°C; industrial unit scaling: 0 to 500°C. DM Area settings are as follows: Thermocouple: 3 (0003 hex) Input signal maximum: 5000 (1388 hex) Input signal minimum: 0 (0000 hex)			
Scaling in industrial units		Data to be stored in the allocated words in the CIO area must be scaled (with the minimum and maximum values set). Data can be stored at 0% to 100%.	Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)			
Data storage in	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits				
Accuracy (25°C	)	$\pm 0.1\%$ (of internal range full span) As shown in the following equation, the accuracy depends on the ratio of the selected internal range (0 to 4) span to the set input range span.				
		Accuracy = $\pm 0.1\%$ x $\frac{\text{Internal range span (electromotive force conversion)}}{\text{Set input range span (electromotive force conversion)}}$				
Temperature coefficient		±0.015% /°C, for any of internal range numbers 0 to 4.				
Resolution		1/4,096 (of internal range full span) As shown in the following equation, the resolution depends on the ratio of the select internal range (0 to 4) span to the set input range span.				
		Hesolution = $\frac{1}{1000}$ x	ge span (electromotive force conversion)			
-	mpensation error	±1°C, at 20 ±10°C				
Warmup time		45 min				
Maximum signal input		–80 to 80 mV				

li li	tem	Specifications			
Input impedanc	е	20 kΩ min.			
Input disconnection detection cur- rent		0.1 μA (typical)			
Response time		1 s (travel time from input 0% to 90%, for step input)			
Conversion per	iod	150 ms/4 inputs			
Maximum time CPU Unit	to store data in	Conversion period + one CPU Unit cycle			
Disconnection of	detection	Detects disconnections at each input and turns ON the Disconnection Detection Flag.			
		Hardware detection time: Approx. 5 s The process value overrange direction for when a disconnection occurs can be speci- fied. (High: 115% of set input range; low: -15% of set input range)			
Function	Mean value pro- cessing (input fil- ter)	Calculates the moving average for the specified number of process values (1 to 16), and stores that value in the CIO Area as the process value.			
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.			
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).			
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.			
Isolation		Between temperature inputs and between input terminals and PLC signals: Isolation by transformer			
Insulation resist	ance	20 M $\Omega$ (at 500 V DC) between inputs			
Dielectric streng	gth	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.			
External conne	ctions	Terminal block (detachable)			
Unit number se	ttings	Set by rotary switches on front panel, from 0 to 95.			
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Ther- mocouple Input Unit, and errors related to the CPU Unit).			
Front panel connector		Sensor input connector terminal block (detachable)			
Alarm time for CPU Unit cycle time		0.3 ms			
Current consumption		5 V DC at 150 mA max., 26 V DC at 150 mA max.			
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$			
		Note The height including the Backplane is 145 mm.			
Weight		450 g max.			
Standard acces	sories	Two cold junction sensors (installed in terminal block)			

#### **Sensor Types and Input Ranges**

The temperature sensor (thermocouple) type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in Table 1.

Table 1: Measurable Input Ranges

Sensor type	DM Area setting	Measurable input range (See note.)
В	0	0 to 1,820°C
E	1	–270 to 1,000°C
J	2	-210 to 1,200°C
К	3	–270 to 1,372°C
Ν	4	–270 to 1,300°C
R	5	–50 to 1,768°C
S	6	–50 to 1,768°C
Т	7	-270 to 400°C
mV	8	-80 to 80 mV

**Note** Set the input range in the DM Area within this range.

Inputs are processed internally in five progressive ranges (numbers 0 to 4), as shown in the following table.

#### Table 2: Internal Ranges

Internal range number	Thermocouple electromotive force	Internal range span
0	–80 to 80 mV	160 mV
1	-40 to 40 mV	80 mV
2	–20 to 20 mV	40 mV
3	-10 to 10 mV	20 mV
4	–5 to 5 mV	10 mV

Therefore, the accuracy and resolution are determined by the ratio of the selected internal range (0 to 4) span to the set input range span (electromotive force converted value). For the internal range, a larger number is selected when both the minimum and maximum values of the range fall within that next range.

For example, suppose that the thermocouple type is K and the set input range is 0 to  $800^{\circ}$ C. The electromotive force for K 0 to  $800^{\circ}$ C is 0 to 33.277 mV. Since both the minimum and maximum values fall within the limits for internal range No. 1 (-40 to 40 mV), that range will be selected.

The following table shows the set input ranges corresponding to the internal range numbers 0 to 4.

**Table 3: Set Input Ranges Corresponding to Internal Ranges** 

Sensor type	Measurable Input range	Internal range No. 0	Internal range No. 1	Internal range No. 2	Internal range No. 3	Internal range No. 4
		–80 to 80 mV	–40 to 40 mV	–20 to 20 mV	–10 to 10 mV	–5 to 5 mV
В	0 to 1,820°C	Not used.	Not used.	0 to 1,820°C	0 to 1,496°C	0 to 1,030°C
E	–270 to 1,000°C	–270 to 1,000°C	–270 to 537°C	–270 to 286°C	–270 to 153°C	–94 to 80°C
J	–210 to 1,200°C	–210 to 1,200°C	–210 to 713°C	–210 to 366°C	–210 to 186°C	–100 to 95°C
К	–270 to 1,372°C	–270 to 1,372°C	–270 to 967°C	–270 to 484°C	–270 to 246°C	–153 to 121°C
Ν	–270 to 1,300°C	–270 to 1,300°C	–270 to 1,097°C	–270 to 584°C	–270 to 318°C	–270 to 171°C
R	–50 to 1,768°C	Not used.	–50 to 1,769°C	–50 to 1,684°C	–50 to 961°C	–50 to 548°C
S	–50 to 1,768°C	Not used.	Not used.	–50 to 1,769°C	–50 to 1,035°C	–50 to 576°C
Т	–270 to 400°C	Not used.	–270 to 400°C	–270 to 385°C	–270 to 213°C	–166 to 115°C
mV	-80 to 80 mV	-80 to 80 mV	–40 to 40 mV	-20 to 20 mV	-10 to 10 mV	–5 to 5 mV

**Note** With Thermocouple Input Units, process values can be scaled in industrial units for the set input range. It is possible to set the process value scaling higher than the resolution, but it will cause the values to be unstable.

# **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

DM Area address				Data range		Default	Data contents	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal

## **Terminal Connection Diagram**

CS1W-PTS01-V1 Isolated-type Thermocouple Input Unit

- **Note** 1. Cold junction sensors are installed between A2 and A3, and between A8 and A9 when the product is shipped. Do not remove them when using the Unit. If they are removed, temperatures cannot be measured correctly because there will be no compensation.
  - 2. Use the same cold junction sensors that come with the Unit, and leave them just as they are. They are provided specifically for this Unit and its circuitry, and temperatures cannot be measured correctly if they are switched around or if another Unit's sensors are used in their place.
  - 3. For unused input terminals, short-circuit the positive and negative sides (e.g., terminals A4 and B4 for input No. 1) of the thermocouple inputs with the lead wire.
  - 4. When connecting input No. 4, remove the cold junction sensor between CJ2+ and CJ2-, and then reconnect it after the input is connected. Attempting to connect the input without removing the cold junction sensor may result in damage to the sensor.

#### **Terminal Block Diagram**

#### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy		
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.		
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.		
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.		
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage has changed. Check for faulty or disconnected wiring. Check whether a wiring disconnection has been detected in the I/O Area.		

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
Cold junction compensation is not operating.	Check the Cold Junction Sensor Error Flag.

Probable cause	Remedy		
No compensation lead wire is being used, or another type of compensation lead wire is being used.	Use the correct compensation lead wire for thermocouples.		
The input wiring is faulty. (The thermocouple or compensation lead wire polarity is wrong.)	Correct the input wiring.		

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the positive and negative input terminals.
	Increase the number of values for calculating the moving average in mean value pro- cessing.
The process value scaling value is greater than the Unit's resolution.	Reduce the process value scaling value.
The input signal range setting is too small.	Match the input signal range to the internal ranges.

# 2-2 CS1W-PTS11 Isolated-type Thermocouple Input Unit

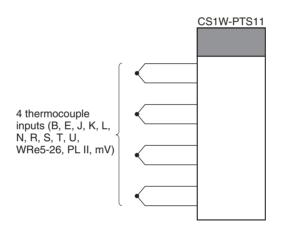

#### **Overview**

The CS1W-PTS11 Isolated-type Thermocouple Input Unit provides four direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PTS11

## **System Configuration**

**Features** 

- Up to four thermocouples can be connected for each Unit (with four separate settings for temperature sensors and input ranges).
- There is isolation between channels, so unwanted circuit paths between thermocouple inputs can be prevented.
- A variety of temperature specifications are supported. Any of the following can be selected for thermocouple input: B, E, J, K, L, N, R, S, T, U, WRe5-26, PL II, mV.
- Resolution of 1/64,000 for all temperature specifications.
- High-speed conversion, at 20 ms/4 inputs and 10 ms/2 inputs.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.

- Maximum or minimum process value can be specified for when a disconnection is detected.
- Adjustment period control.
- Peak and bottom detection.
- Top and valley detection.

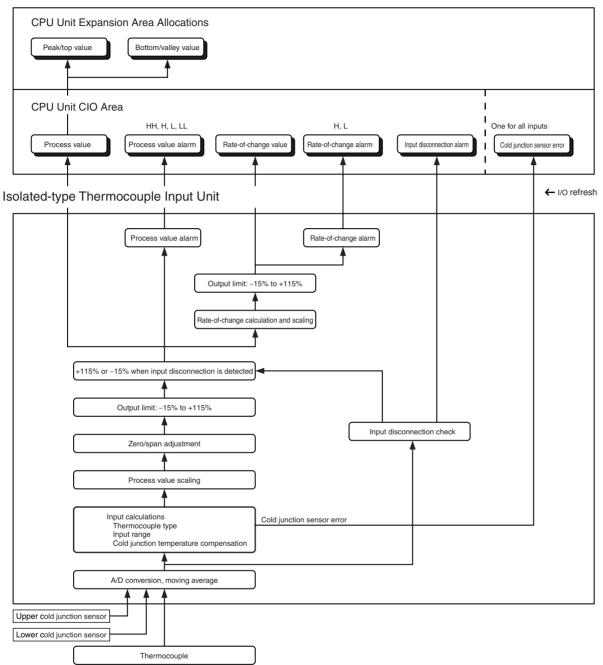

### Model Information

Unit classification	Model number	Inputs	Temperature sensor types
CS-series Special I/O Unit	CS1W-PTS11	4	B, E, J, K, L, N, R, S, T, U, WRe5-26, PL II, mV

# Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

**CPU Unit** 

# **Specifications**

Item		Specifications		
Model	-	CS1W-PTS11		
Applicable PLC		CS Series		
Unit classification		CS-series Special I/O Unit		
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)		
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)		
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)		
Areas for data	Special I/O Unit	10 words/Unit		
exchange with CPU Unit	Area	Thermocouple Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, cold junction sensor errors		
	DM Area words	100 words/Unit		
	allocated to Special I/O Units	CPU Unit to Thermocouple Input Unit: Temperature sensor type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, rate-of-change input range, scaling of rate-of- change data, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value, etc.		
	Expansion Con-	35 words/Unit		
	trol/Monitor Area	CPU Unit to Thermocouple Input Unit:		
		Designations and flags for beginning or resetting the hold function selection, adjust- ment period control, etc.		
		Thermocouple Input Unit to CPU Unit:		
		Adjustment period notices (with each input), peak and bottom values, top and valley values		
	Expansion Set- ting Area	46 words/Unit		
		CPU Unit to Thermocouple Input Unit:		
		Expansion Control/Monitor Area settings, adjustment period control, peak and bottom detection, top and valley detection		
Number of temp inputs	erature sensor	4		
Temperature set	nsor types	The sensor type, input range, and scaling can be set individually for each of 4 inputs, which are each selectable from B, E, J, K, L, N, R, S, T, U, WRe5-26, PL II, and mV.		
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (individually for each of the 4 inputs, with the minimum and maximum values set). Data can be stored at 0% to 100%.		
Data storage in	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits		
Accuracy (25°C)	)	$\pm 0.05\%$ (Depends on the Sensor used and the measured temperature. Refer to Accuracy by Sensor Type and Measured Temperature Range on page 75 for details.)		
Temperature co	efficient	±0.01% /°C (For full scale of electromotive force. See note.)		
Resolution		1/64,000		
Cold junction compensation error		± 1°C, at 20°C ± 10°C		
Warmup time		45 min		
Maximum signal input		± 120 mV		
Input impedance		20 kΩ min.		
Input disconnection detection cur- rent		0.1 μA (typical)		
Response time		100 ms (travel time from input 0% to 90%, for $\pm 100$ mV step input and with moving average for 4 samples)		
Conversion peri	od	20 ms/4 inputs, 10 ms/2 inputs. Can be switched in DM Area words allocated to the Unit as a Special I/O Unit.		

lt	em	Specifications	
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle	
Disconnection detection		Detects disconnections at each input and turns ON the Disconnection Detection Flag.	
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a disconnection occurs can be spec fied. (High: 115% of set input range; low: -15% of set input range)	
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 128), and stores that value in the CIO Area as the process value.	
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.	
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).	
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.	
	Adjustment period control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and number of days notice have elapsed, this function turns ON a warning flag to give notice that it is time for readjust- ment.	
	Peak and bot- tom detection	This function detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF, and stores them in the Expansion Control/Monitor Area.	
	Top and valley detection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF, and stores them in the Expansion Control/Monitor Area.	
Isolation		Between inputs and PLC signals, and between inputs: Isolation by transformer for power supply, and by photocoupler for signals.	
Insulation resista	ance	20 MΩ (at 500 V DC) between inputs	
Dielectric streng	th	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.	
External connec	tions	Terminal block (detachable)	
Unit number set	tings	Set by rotary switches on front panel, from 0 to 95.	
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Ther- mocouple Input Unit, and errors related to the CPU Unit).	
Front panel conr	nector	Sensor input connector terminal block (detachable)	
Alarm time for CPU Unit cycle time		0.3 ms	
Current consumption (supplied from Power Supply Unit)		5 V DC at 120 mA max., 26 V DC at 80 mA max.	
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$	
		Note The height including the Backplane is 145 mm.	
Weight		450 g max.	
Standard accessories		Two cold junction sensors (mounted to terminal block)	

**Note** The method for calculating the error in temperature measurements, including the temperature coefficient, is given below. The "full scale of electromotive force" is the difference between the high limit and low limit converted to electromotive force for each thermocouple.

Example

Ambient temperature: 30 °C Temperature Sensor: K thermocouple (–270 to 1,372 °C) Measured temperature: 500 °C

From electromotive force table 450 14

–270 °C:	-6.458 MV	
1,372 °C:	<u>54.86 mV</u>	
	Full scale:	61.344

Electromotive conversion of temperature coefficient:

 $61.344 \text{ mV} \times \pm 0.01\%^{\circ}\text{C} = \pm 6.13 \mu\text{V}^{\circ}\text{C}$ 

Error in electromotive force at 30°C:

 $\pm 6.13 \ \mu V/^{\circ}C \ x \ (30^{\circ}C - 25^{\circ}C) = 30.65 \ \mu V/^{\circ}C$ 

Temperature difference between measurement point and terminals on Unit (ambient temperature) (based on ambient temperature of 30 °C and Measured temperature of 500 °C): 470 °C

Electromotive force per °C at a measured temperature of 470 °C (from the electromotive force tables for a K thermocouple):

43 μV/°C

Error in temperature coefficient:  $\pm 30.65 \,\mu\text{V} \div 43 \,\mu\text{V/}^{\circ}\text{C} = \pm 0.7^{\circ}\text{C}$ 

Error in measured temperature = Accuracy ± Error from temperature coefficient + Error in cold junction compensation =  $\pm 0.8^{\circ}C + \pm 0.7^{\circ}C + \pm 1.0^{\circ}C =$ ±2.5°C

#### Sensor Type and Input Range

The Temperature Sensor type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in the following table. Accuracy and resolution, however, are not determined from the set input range, but rather from the measurable input range shown in the following table. Therefore, accuracy and resolution do not change even when a narrow input range is set.

Sensor type	DM Area setting	Measurable input range
В	0	0 to 1,820°C
E	1	–270 to 1,000°C
J	2	–210 to 1,200°C
К	3	–270 to 1,372°C
Ν	4	–270 to 1,300°C
R	5	–50 to 1,768°C
S	6	–50 to 1,768°C
Т	7	–270 to 400°C
mV	8	-100 to 100 mV
L	9	–200 to 900°C
U	10	–200 to 600°C
WRe5-26	11	0 to 2,300°C
PLII	12	0 to 1,300°C

#### Accuracy by Sensor Type and Measured Temperature Range

Sensor type	Temperature range	Standard accuracy	Details
В	0 to 1,820°C	±1.8°C (±0.1%)	400 to 800°C: ±3°C Less than 400°C: Accuracy is not specified.
E	–270 to 1,000°C	±0.6°C (±0.05%)	–250 to 200°C: ±1.2°C Less than –250°C: Accuracy is not specified.
J	–210 to 1,200°C	±0.7°C (±0.05%)	
К	–270 to 1,372°C	±0.8°C (±0.05%)	–250 to 200°C: ±2°C Less than –250°C: Accuracy is not specified.

### CS1W-PTS11 Isolated-type Thermocouple Input Unit

Sensor type	Temperature range	Standard accuracy	Details
N	–270 to 1,300°C	±0.8°C (±0.05%)	–200 to 150°C: ±1.6°C Less than –200°C: Accuracy is not specified.
R	–50 to 1,769°C	±1.8°C (±0.1%)	0 to 100°C: ±2.5°C Less than 0°C: Accuracy is not specified.
S	–50 to 1,769°C	±1.8°C (±0.1%)	0 to 100°C: ±2.5°C Less than 0°C: 3.2°C
Т	–270 to 400°C	±0.35°C (±0.05%)	-180 to 0°C: ±0.7°C
			–200 to –180°C: ±1.3°C
			Less than -200°C: Accuracy is not specified.
L	–200 to 900°C	±0.5°C (±0.05%)	
U	–200 to 600°C	±0.4°C (±0.05%)	-100 to 0°C: ±0.5°C
			Less than -100°C: ±0.7°C
WRe5-26	0 to 2,315°C	±1.2°C (±0.05%)	More than 2,200°C: ±1.4°C
PLII	0 to 1,395°C	±0.7°C (±0.05%)	

# **DM Area Allocations**

#### First word: m = D20000 + unit number × 100 (unit number: 0 to 95)

DM Area address			Data range		Default	Data contents			
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal				
Expansio	Expansion Setting Area allocations								
m+98			0 to 5	0000 to 0005 hex		Expansion Setting Area allocations: 0: Not used; 1: DM; 2: CIO; 3: W; 4: H; 5: EM			
m+99		0 to 32767	0000 to 7FFF hex		Expansion Setting Area first word				

- Note 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area), or in the Expansion Setting Area. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal. If the first memory address containing the out-of-range error will be over +100 (or +100 if the first word in the Expansion Setting Area is an error).
  - 2. When specifying an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
  - 3. When specifying the first word in an expansion setting area, be sure that the end of the memory area is not exceeded.

## **Expansion Setting Area**

First word: word o. (o = address specified in word m+99 in the area specified in word m+98 in the DM Area)

	DM Are	a address	;	Dat	a range	Default	Data contents
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal	-

### **Terminal Connection Diagram**

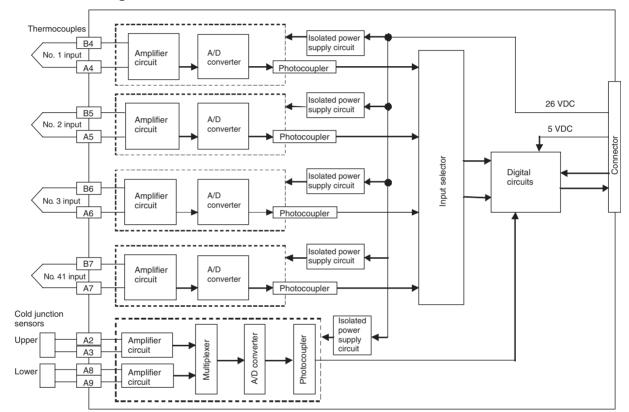

Note Action for Unused Input Terminals

- Short-circuit the positive (+) and negative (-) sides of the thermocouple input section using a lead wire. For example, short terminals A4 and B4 for No. 1 thermocouple input.
- Cold junction sensors are mounted between A2 and A3, and A8 and A9 before shipment. If one of the cold junction sensors is disconnected, cold junction compensation will stop and correct measurement of temperatures cannot be made. Always make sure the cold junction sensors are connected when using the Units.
- Cold junction sensors are calibrated separately for each Unit and connected circuit, so correct temperatures will not be measured if a cold junc-

tion sensor from another Unit is used or if the two cold junction sensors in a Unit are swapped. Use the cold junction sensors as they are provided, without making any changes.

- When wiring No. 4 thermocouple input terminals (\*1 in the above diagram), remove the cold junction sensor between terminals CJ2+ and CJ2- at the bottom (\*2 in the above diagram), connect the No. 4 thermocouple input, and then reconnect the cold junction sensor. Any attempt to connect No. 4 thermocouple input without removing the cold junction sensor may result in damage to the cold junction sensor.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

### **Terminal Block Diagram**

## Error Processing

#### **Conversion Data Does Not Change.**

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a wiring disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
Cold junction compensation is not operating.	Check the Cold Junction Error Flag.
A compensation conductor has not been used or a different com- pensation conductor is used.	Use the correct compensation conductor for the thermocouple.
Incorrect input wiring (incorrect thermocouple or compensation conductor polarity.)	Correct the input wiring.

#### Converted Values are Unstable.

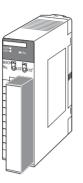

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert a 0.01 to 0.1 $\mu$ F ceramic capacitor between the positive (+) and negative (–) input terminals.
	Increase the number of values for calculating the moving average in mean value processing.
The process value scaling value is greater than the Unit's resolution.	Reduce the process value scaling value.
The input signal range setting is too small.	Match the input signal range to the internal ranges.

# 2-3 CS1W-PTS51 Isolated-type Thermocouple Input Unit

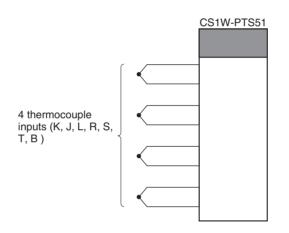

#### **Overview**

The CS1W-PTS51 Isolated-type Thermocouple Input Unit provides four direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PTS51

# **System Configuration**

**Features** 

- Up to four thermocouples can be connected for each Unit (with four separate settings for temperature sensors and input ranges).
- There is isolation between channels, so unwanted circuit paths between thermocouple inputs can be prevented.
- A variety of temperature specifications are supported. Any of the following can be selected for thermocouple input: K, J, L, R, S, T, B. (Decimal points can be selected for K, J, and L.)
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Binary or BCD can be selected for the data output format.)
- Process value alarm (with two internal alarms in memory and one external alarm output for each input).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

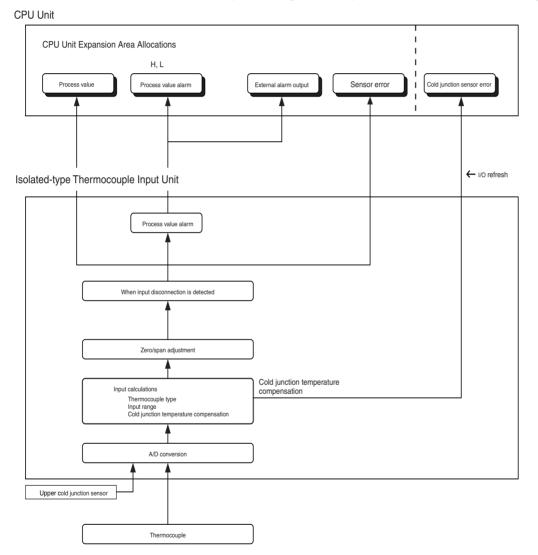

### CS1W-PTS51 Isolated-type Thermocouple Input Unit

#### **Model Information**

Unit classification	Model number	Inputs	Temperature sensor types	
CS-series Special I/O Unit	CS1W-PTS51	4	K, J, L, R, S, T, B	

# Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

# **Specifications**

Item		Specifications			
Model		CS1W-PTS51			
Applicable PLC		CS Series			
Unit classificatio	n	CS-series Special I/O Unit			
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)			
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Isolated-type Thermocouple Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flags, sensor errors, cold junction sensor errors			
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Isolated-type Thermocouple Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.			
Number of temp inputs	erature sensor	4			
Temperature sei	nsor types	The sensor type be set individually for each of 4 inputs, which are each selectable from K, J, L, R, S, T, B.			
Data storage in	the CIO Area	The actual process data in the input range is stored in four digits hexadecimal (binary or BCD values) in the allocated words in the CIO Area.			
Accuracy (25°C)	) (See note.)	With celsius selected: $\pm 0.3\%$ of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit max. With fahrenheit selected: $\pm 0.3\%$ of PV or $\pm 2^{\circ}$ F, whichever is greater, $\pm 1$ digit max. However, the accuracy of K and T at $-100^{\circ}$ C or lower and L is $\pm 2^{\circ}$ C $\pm 1$ digit max. The accuracy of R and S at 200°C or lower is $\pm 3^{\circ}$ C $\pm 1$ digit max. The accuracy of B at 400°C or lower is not specified.			
To some over the set of the		PV: Process value data			
Temperature cha	aracteristic	Refer to <i>Temperature Characteristics According to Thermocouple Type</i> on page 92.			
Warmup time	1	30 min			
Conversion perio Maximum time t CPU Unit		250 ms/4 inputs. Conversion period + one CPU Unit cycle			
Sensor error del	tection	Detects sensor error at each input and turns ON the Sensor error Flag. Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: +20 digit of set input range; low: -20 digit of set input range)			
Functions	Process value alarm	Process value 2-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available. External alarm outputs: One per input (H or L).			
	External alarm outputs	NPN outputs (with short-circuit protection) External power supply voltage: 20.4 to 26.4 V DC Max. switching capacity: 100 mA (for one output) Leakage current: 0.3 mA max. Residual voltage: 3 V max.			
Isolation		Between inputs and PLC signals: Transformer for power supply and photocoupler for signals. Between each input: Transformer for power supply and photocoupler for signals.			
Insulation resistance		20 MΩ max. (at 500 V DC). Between all output and NC terminals and external AC terminals (Power Supply Unit) Between all input terminals and external AC terminals (Power Supply Unit) Between all input terminals and all output terminals Between all external DC terminals (input, output, and NC terminals) and FG plate Between all input and output terminals and all NC terminals			

Item	Specifications
Dielectric strength	Between all output and NC terminals and external AC terminals (Power Supply Unit) 2,000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all input terminals and external AC terminals (Power Supply Unit)
	Between all input terminals and all output terminals
	Between all external DC terminals (input, output, and NC terminals) and FG plate 1,000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all channels 500 VAC, 50/60 Hz 1 min., detection current: 1mA
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Seven LED indicators on front panel (for normal operation, errors detected at the Thermocouple Input Unit, errors related to the CPU Unit, and four indicators for external alarm outputs.)
Alarm time for CPU Unit cycle time	0.4 ms
Current consumption (supplied from Power Supply Unit)	5 V DC at 250 mA max.
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.

**Note** The heat generated by a Unit will dramatically change the accuracy specifications when more than one C200HW-PA209R or CS1W-ID291 Unit is mounted side-by-side.

The following accuracy specifications apply under such conditions. With celcius selected:

 $\pm 0.3\%$  of PV or  $\pm 1.3$ °C, whichever is greater,  $\pm 1$  digit max.

With Fahrenheit selected:

 $\pm$  0.3% of PV or  $\pm$  3°F, whichever is greater,  $\pm$ 1 digit max.

However, the accuracy of K and T at  $-100^{\circ}$ C or less and L is  $\pm 3^{\circ}$ C  $\pm 1$  digit max. The accuracy of R and S at 200°C or less is  $\pm 4^{\circ}$ C  $\pm 1$  digit max. The accuracy of B at 400°C or less is not specified.

### Sensor Type and Input Range

The Temperature Sensor type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input	°C			°F		
ting		16-bit binary	BCD		16-bit binary	BCD	
			F indicates minus sign.	Leftmost bit indicates minus sign.		F indicates minus sign.	Leftmost bit indicates minus sign.
0		0514			08FC	F300 to 2300 (-300 to 2300)	F300 to 2300 (–300 to 2300)
1	K: 0.0 to 500°C (0.0 to 900.0°F)		0000 to 5000 (0.0 to 500.0)			0000 to 9000 (0.0 to 900.0)	0000 to 7999 (See note 3.) (0.0 to 799.9)
2	J: −100 to 850°C (−100 to 1500°F)		(–100 to 850)			F100 to 1500 (–100 to 1500)	8100 to 1500 (–100 to 1500)
3	J: 0.0 to 400.0°C (0.0 to 750.0°F)		0000 to 4000 (0.0 to 400.0)			0000 to 7500 (0.0 to 750.0)	

Set-	Input		°C		°F		
ting		16-bit binary	BCD		16-bit binary	BCD	
			F indicates minus sign.	Leftmost bit indicates minus sign.		F	Leftmost bit indicates minus sign.
4	T: -200 to 400°C (-300 to 700.0°F)	0FA0 (–200.0 to –0.1 to	(See note 3.)	A000 to 4000 (-200.0 to 400.0)	F448 to FFFF to 1B58 (–300.0 to –0.1 to 700.0)	F999 to 7000 (See note 3.) (–99.9 to 700.0)	B000 to 7000 (-300.0 to 700.0)
5	L: –100 to 850°C (–100 to 1500°F)		F100 to 0850 (–100 to 850)		FF9C to FFFF to 05DC (–100 to –1 to 1500)	F100 to 1500 (–100 to 1500)	8100 to 1500 (–100 to 1500)
6	L: 0.0 to 400.0°C (0.0 to 750.0°F)				0000 to 1D4C (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)
7	R: 0 to 1700°C (0 to 3000°F)			0000 to 1700 (0 to 1700)	0000 to 0BB8 (0 to 3000)	0000 to 3000 (0 to 3000)	0000 to 3000 (0 to 3000)
8	S: 0 to 1700°C (0 to 3000°F)			0000 to 1700 (0 to 1700)	0000 to 0BB8 (0 to 3000)	0000 to 3000 (0 to 3000)	0000 to 3000 (0 to 3000)
9	B: 400 to 1800°C (See note 2.) (750 to 3200°F)		0400 to 1800 (400 to 1800)		02EE to 0C80 (750 to 3200)	0750 to 3200 (750 to 3200)	0750 to 3200 (750 to 3200)

Note 1. If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.

- 2. The lower limit for B thermocouples is 0°C/°F.
- The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs. For 0.1°C/0.1°F indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9. For 0.1°C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

#### **Temperature Characteristics According to Thermocouple Type**

Thermocouple	Temperature range	Set value error when ambient temperature changes by 1°C
R	0 to 200°C	±0.43°C
	200 to 1,000°C	±0.29°C
	1,000 to 1,700°C	±285 ppm of PV
S	0 to 200°C	±0.43°C
	200 to 1,000°C	±0.29°C
	1,000 to 1,700°C	285 ppm of PV
В	400°C or less	Not specified.
	400 to 800°C	±0.43°C
	800 to 1,000°C	±0.29°C
	1,000 to 1,800°C	285 ppm of PV
К	–200 to –100°C	±0.29°C
	-100 to 400°C	±0.11°C
	400 to 1,300°C	±285 ppm of PV
J	-100 to 400°C	±0.11°C
	400 to 850°C	±285 ppm of PV
Т	–200 to –100°C	±0.29°C
	-100 to 400°C	±0.11°C
L	-100 to 400°C	±0.11°C
	400 to 850°C	±285 ppm of PV

The measured temperature error is calculated as shown in the following example.

Item	Details
Ambient temperature	30°C
Thermocouple type	К
Measured temperature (PV)	500°C
Reference accuracy (25°C)	$\pm 0.3^{\circ}$ C of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit.
	In this example, $\pm 1.5^{\circ}$ C.
Temperature characteristics	400 to 1,300°C: 285 ppm of PV.
	In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient temper- ature	5°C (25 to 30°C).

Overall accuracy =

Reference accuracy + Temperature characteristic × Change in ambient temperature =  $\pm 1.5^{\circ}C + \pm 0.143^{\circ}C \times 5$  = Approx.  $\pm 2.2^{\circ}C \pm 1$  digit.

## **DM Area Allocations**

First word:  $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

	DM Area	address		Data	range	Default	Data contents
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
m				12345, 0	3039, 0000 hex	0000 hex	<ul> <li>Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM words m+1 to m+93.</li> <li>12345 (3039 hex): The data in words m+1 to m+93 is transferred from the Thermo- couple Input Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.</li> <li>Other than 12345 (3039 hex) (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Thermocouple Input Unit.</li> </ul>

**Note** 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area). The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

Word	Bits	Description	Settings
m+18	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

2. The operation settings are shown in the following table.

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 will contain 1000.

3. Indicates the value after transferring the default value (set when 12345 is written to word m).

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

#### **Terminal Connection Diagram**

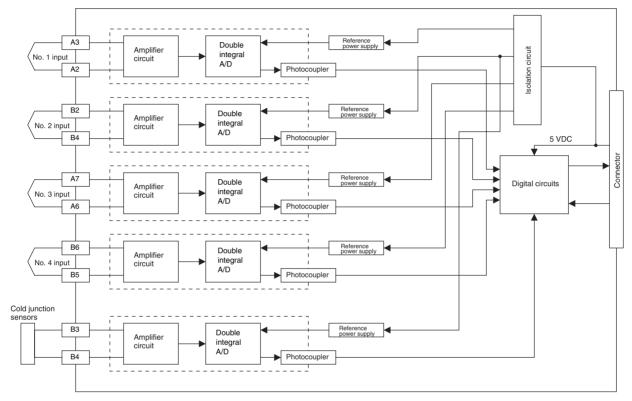

Note Action for Unused Input Terminals

- Short-circuit the positive (+) and negative (-) sides of the thermocouple input section using a lead wire. For example, short terminals A3 and A2 for No. 1 thermocouple input.
- Cold junction sensors are mounted before shipment. If one of the cold junction sensors is disconnected, cold junction compensation will stop and correct measurement of temperatures cannot be made. Always make sure the cold junction sensors are connected when using the Units.
- Cold junction sensors are calibrated separately for each Unit and connected circuit, so correct temperatures will not be measured if a cold junction sensor from another Unit is used or if the two cold junction sensors in a Unit are swapped. Use the cold junction sensors as they are provided, without making any changes.

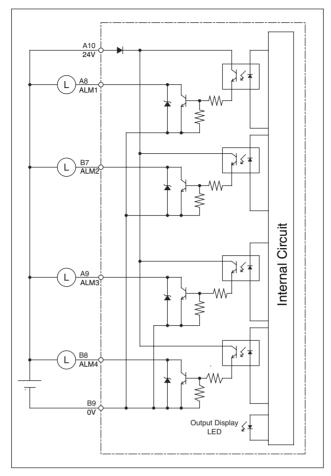

- Do not connect anything to NC terminals. Do not use NC terminals as relay terminals.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

## **Terminal Block Diagram**

#### ■ Input Circuits

#### ■ Output Circuits

## Error Processing

Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a sensor error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type is not set cor- rectly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
Cold junction compensation is not operating.	Check the Cold Junction Error Flag.
A compensation conductor has not been used or a different com- pensation conductor is used.	Use the correct compensation conductor for the thermocouple.
Incorrect input wiring (incorrect thermocouple or compensation conductor polarity.)	Correct the input wiring.
Thermocouple lead or compensat- ing conductor is too long and mea- surements are being affected by conductor resistance.	Use a thicker compensating conductor. Change the wiring position and shorten the com- pensating conductor.
The terminal block temperature is not uniform due to radiated heat from peripheral devices.	Mount the unit in a position unaffected by radiated heat.

#### Converted Values are Unstable.

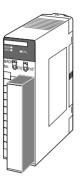

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert a 0.01 to 0.1 $\mu$ F ceramic capacitor between the positive (+) and negative (-) input terminals.
An airflow is hitting the Unit termi- nal block.	Move the terminal block to a position unaffected by airflow.

# 2-4 CS1W-PTS55 Isolated-type Thermocouple Input Unit

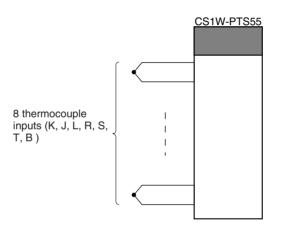

#### **Overview**

The CS1W-PTS55 Isolated-type Thermocouple Input Unit provides 8 direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PTS55

## **System Configuration**

## **Features**

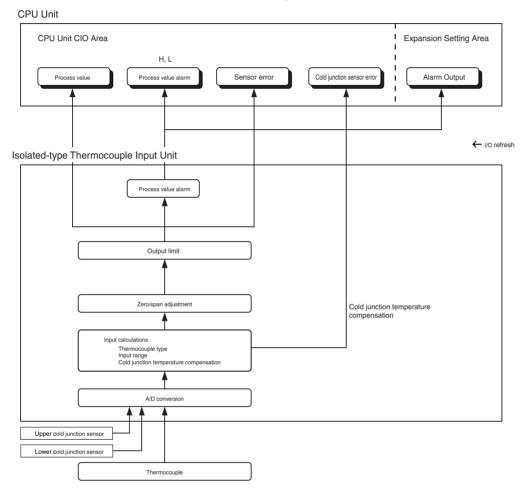

- Up to 8 thermocouples can be connected for each Unit (with 8 separate settings for temperature sensors and input ranges).
- There is isolation between channels, so unwanted circuit paths between thermocouple inputs can be prevented.
- A variety of temperature specifications are supported. Any of the following can be selected for thermocouple input: K, J, L, R, S, T, B. (Decimal points can be selected for K, J, and L.)
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Binary or BCD can be selected for the data output format.)
- Process value alarms (Two internal alarms per input can be output to memory and two alarms per input can be output to specified I/O memory area addresses using indirect address specifications).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

#### **Model Information**

Unit classification	Model number	Inputs	Temperature sensor types
CS-series Special I/O Unit	CS1W-PTS55	8	K, J, L, R, S, T, B

## Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

# **Specifications**

lt	em	Specifications		
Model		CS1W-PTS55		
Applicable PLC		CS Series		
Unit classification		CS-series Special I/O Unit		
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)		
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)		
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)		
Areas for data	Special I/O Unit	10 words/Unit		
exchange with CPU Unit	Area	Isolated-type Thermocouple Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flags, sensor errors, cold junction sensor errors		
	DM Area words	100 words/Unit		
	allocated to Special I/O Units	CPU Unit to Isolated-type Thermocouple Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.		
	Expansion Set-	1 word/Unit		
	ting Area	CPU Unit to Isolated-type Thermocouple Input Unit: Process Value Alarm		
Number of temp inputs	erature sensor	8		
Temperature ser	nsor types	The sensor type be set individually for each of 8 inputs, which are each selectable from K, J, L, R, S, T, B ("Not used" can be selected).		
Data storage in	the CIO Area	The actual process data in the input range is stored in four digits hexadecimal (binary or BCD values) in the allocated words in the CIO Area.		
Accuracy (25°C)	)	With celsius selected: $\pm 0.3\%$ of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit max.		
		With fahrenheit selected: $\pm 0.3\%$ of PV or $\pm 2^{\circ}$ F, whichever is greater, $\pm 1$ digit max.		
		However, the accuracy of K and T at $-100^{\circ}$ C or lower and L is $\pm 2^{\circ}$ C $\pm 1$ digit max.		
		The accuracy of R and S at 200°C or lower is $\pm 3^{\circ}C \pm 1$ digit max.		
		The accuracy of B at 400°C or lower is not specified.		
		PV: Process value data		
Temperature cha	aracteristic	Refer to <i>Temperature Characteristics According to Thermocouple Type</i> on page 103.		
Warmup time		30 min		
Conversion perio	od	250 ms/8 inputs.		
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle		
Sensor error det	tection	Detects sensor error at each input and turns ON the Sensor error Flag.		
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: +20 digit of set input range; low: -20 digit of set input range)		
Functions	Process value alarm	Process value 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.		
		Two alarms per input (H, L) can be output to addresses in the CIO Area specified in the Expansion Setting Area.		
Isolation		Between inputs and PLC signals: Transformer for power supply and photocoupler for signals.		
		Between each input: Transformer for power supply and photocoupler for signals.		
Insulation resistance		20 MΩ max. (at 500 V DC).		
		Between all input terminals and external AC terminals (Power Supply Unit)		
		Between all external DC terminals (input and NC terminals) and FG plate		
		Between all input and all NC terminals		

Item	Specifications
Dielectric strength	Between NC terminals and external AC terminals (Power Supply Unit) 2,000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all input terminals and external AC terminals (Power Supply Unit)
	Between all external DC terminals (input and NC terminals) and FG plate 1000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all channels 500 VAC, 50/60 Hz 1 min., detection current: 1mA
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Three LED indicators on front panel (for normal operation, errors detected at the Unit, errors related to the CPU Unit)
Alarm time for CPU Unit cycle time	0.4 ms
Current consumption (supplied	5 V DC at 180 mA max.
from Power Supply Unit)	26 V DC at 60 mA max.
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.

## Sensor Type and Input Range

The Temperature Sensor type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input		°C		°F			
ting		16-bit binary	BC	D	16-bit binary	B	CD	
			F □ □ □ indicates minus sign.	Leftmost bit indicates minus sign.		F indicates minus sign.	Leftmost bit indicates minus sign.	
0	K: –200 to 1300°C (–300 to 2300°F)	0514	F200 to 1300 (–200 to 1300)	8200 to 1300 (–200 to 1300)	FED4 to FFFF to 08FC (-300 to -1 to 2300)	F300 to 2300 (-300 to 2300)	F300 to 2300 (–300 to 2300)	
1	K: 0.0 to 500°C (0.0 to 900.0°F)		0000 to 5000 (0.0 to 500.0)		0000 to 2328 (0.0 to 900.0)	0000 to 9000 (0.0 to 900.0)		
2	J: −100 to 850°C (−100 to 1500°F)			8100 to 0850 (-100 to 850)	FF9C to FFFF to 05DC (–100 to –1 to 1500)	F100 to 1500 (-100 to 1500)	8100 to 1500 (–100 to 1500)	
3	J: 0.0 to 400.0°C (0.0 to 750.0°F)				0000 to 1D4C (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	
4	T: -200 to 400°C (-300 to 700.0°F)	0FA0 (–200.0 to –0.1 to	F999 to 4000 (See note 3.) (–99.9 to 400.0)	A000 to 4000 (–200.0 to 400.0)	F448 to FFFF to 1B58 (–300.0 to –0.1 to 700.0)	F999 to 7000 (See note 3.) (–99.9 to 700.0)	B000 to 7000 (-300.0 to 700.0)	
5	L: –100 to 850°C (–100 to 1500°F)			8100 to 0850 (-100 to 850)	FF9C to FFFF to 05DC (–100 to –1 to 1500)	F100 to 1500 (-100 to 1500)	8100 to 1500 (–100 to 1500)	
6	L: 0.0 to 400.0°C (0.0 to 750.0°F)	0000 to 0FA0 (0.0 to 400.0)			0000 to 1D4C (0.0 to 750.0)		0000 to 7500 (0.0 to 750.0)	
7	R: 0 to 1700°C (0 to 3000°F)	0000 to 06A4 (0 to 1700)	0000 to 1700 (0 to 1700)	0000 to 1700 (0 to 1700)	0000 to 0BB8 (0 to 3000)	0000 to 3000 (0 to 3000)	0000 to 3000 (0 to 3000)	

Set-	Input		°C		°F			
ting	16-bit binary BCD		D	16-bit binary	B	CD		
			F indicates minus sign.	Leftmost bit indicates minus sign.		F indicates minus sign.	Leftmost bit indicates minus sign.	
8					0000 to 0BB8 (0 to 3000)		0000 to 3000 (0 to 3000)	
9	B: 400 to 1800°C (See note 2.) (750 to 3200°F)		0400 to 1800 (400 to 1800)			0750 to 3200 (750 to 3200)		

- Note 1. If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.
  - 2. The lower limit for B thermocouples is 0°C/°F.
  - The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs. For 0.1°C/0.1°F indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9. For 0.1°C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

#### **Temperature Characteristics According to Thermocouple Type**

Thermocouple	Temperature range	Set value error when ambient temperature changes by 1°C	
R	0 to 200°C	±0.43°C	
	200 to 1,000°C	±0.29°C	
	1,000 to 1,700°C	±285 ppm of PV	
S	0 to 200°C	±0.43°C	
	200 to 1,000°C	±0.29°C	
	1,000 to 1,700°C	285 ppm of PV	
В	400°C or less	Not specified.	
	400 to 800°C	±0.43°C	
	800 to 1,000°C	±0.29°C	
	1,000 to 1,800°C	285 ppm of PV	
К	–200 to –100°C	±0.29°C	
	-100 to 400°C	±0.11°C	
	400 to 1,300°C	±285 ppm of PV	
J	-100 to 400°C	±0.11°C	
	400 to 850°C	±285 ppm of PV	
Т	–200 to –100°C	±0.29°C	
	-100 to 400°C	±0.11°C	
L	-100 to 400°C	±0.11°C	
	400 to 850°C	±285 ppm of PV	

The measured temperature error is calculated as shown in the following example.

ltem	Details
Ambient temperature	30°C
Thermocouple type	к
Measured temperature (PV)	500°C

Item	Details
Reference accuracy (25°C)	$\pm 0.3^{\circ}$ C of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit.
	In this example, $\pm 1.5^{\circ}$ C.
Temperature characteristics	400 to 1,300°C: 285 ppm of PV.
	In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient temper- ature	5°C (25 to 30°C).

Overall accuracy =

Reference accuracy + Temperature characteristic × Change in ambient temperature =  $\pm 1.5^{\circ}C + \pm 0.143^{\circ}C \times 5$  = Approx.  $\pm 2.2^{\circ}C \pm 1$  digit.

m+37	m+40	m+43	m+46	m+49	m+52	m+55	m+58	0 to 60	0000 to 003C hex	0 (0000 hex)	Unit: s
								•	•		Expansion Setting Area enable
m+59								0, 1	0000, 0001 hex	0 (0000 hex)	0: Disabled 1: Enabled
											Expansion Setting Area address
m+60 (See n	ote 3)							0 to 6143	0000 to 17FF hex	0 (0000 hex)	CIO area (fixed) Number of words.

- Note 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area). The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.
  - 2. The operation settings are shown in the following table
  - 3. A range check is not performed for the Expansion Setting Area address set in word m+60. Be sure to check this address before starting actual operation.

Word	Bits	Description	Settings
m+34	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 will contain 1000.

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

## **Terminal Connection Diagram**

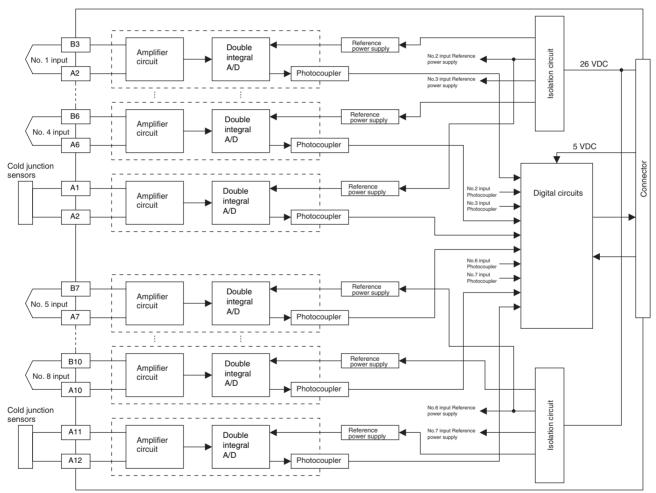

Note

- Set the *Sensor type* in Setting Group 2 in the DM Area to "Not used" for any thermocouple inputs that are not used.
  - Cold junction sensors are mounted before shipment. If one of the cold junction sensors is disconnected, cold junction compensation will stop

and correct measurement of temperatures cannot be made. Always make sure the cold junction sensors are connected when using the Units.

- Cold junction sensors are calibrated separately for each Unit and connected circuit, so correct temperatures will not be measured if a cold junction sensor from another Unit is used or if the two cold junction sensors in a Unit are swapped. Use the cold junction sensors as they are provided, without making any changes.
- Do not connect anything to NC terminals. Do not use NC terminals as relay terminals.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

#### **Terminal Block Diagram**

#### Input Circuits

#### **Error Processing**

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a sensor error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type is not set cor- rectly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
Cold junction compensation is not operating.	Check the Cold Junction Error Flag.
A compensation conductor has not been used or a different com- pensation conductor is used.	Use the correct compensation conductor for the thermocouple.
Incorrect input wiring (incorrect thermocouple or compensation conductor polarity.)	Correct the input wiring.
Thermocouple lead or compensat- ing conductor is too long and mea- surements are being affected by conductor resistance.	Use a thicker compensating conductor. Change the wiring position and shorten the com- pensating conductor.
The terminal block temperature is not uniform due to radiated heat from peripheral devices.	Mount the unit in a position unaffected by radiated heat.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert a 0.01 to 0.1 $\mu$ F ceramic capacitor between the positive (+) and negative (–) input terminals.
An airflow is hitting the Unit termi- nal block.	Move the terminal block to a position unaffected by airflow.

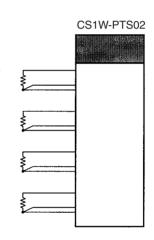

# 2-5 CS1W-PTS02 Isolated-type Resistance Thermometer Input Unit (Pt100 or JPt100)

#### <u>Overview</u>

The CS1W-PTS02 Isolated-type Resistance Thermometer Input Unit provides four direct platinum resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

## **System Configuration**

Four resistance thermometer inputs (Pt100 or JPt100)

## Features

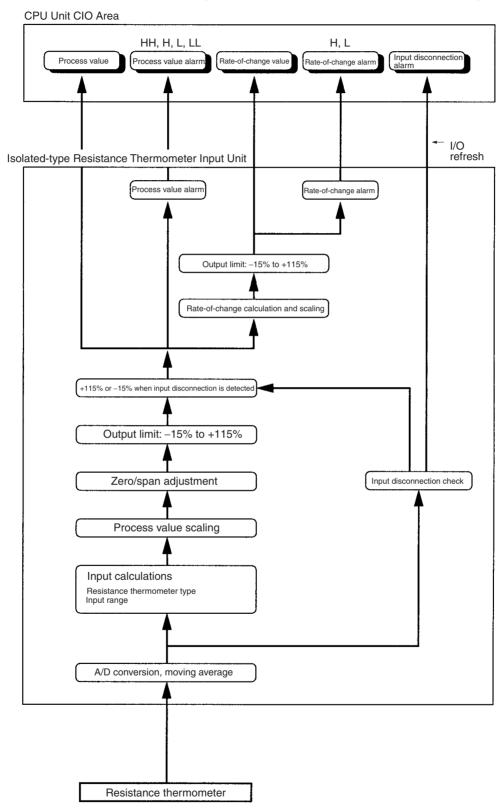

- Up to four platinum resistance thermometers can be connected for each Unit (with four separate settings for temperature sensors and input ranges).
- Pt100 (JIS, IEC) or JPt100 can be selected.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- Maximum or minimum process value can be specified for when a disconnection is detected.

# Model Information

Unit classification	Model number	Inputs	Temperature sensor types
CS-series Special I/O Unit	CS1W-PTS02	4	Platinum resistance thermometer Pt100 (JIS, IEC) or JPt100.

## Block Diagram (Order of Processing)

The processing for the four inputs is as shown in the following diagram.

# **Specifications**

Item		Specifications					
Model		CS1W-PTS02					
Applicable PLC		CS Series					
Unit classification		CS-series Special I/O Unit					
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)					
Maximum numbe	er of Units	80 (within the allowable current consumption	on and power consumption range)				
Unit numbers		00 to 95 (Cannot duplicate Special I/O Uni	t numbers.)				
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, cold junction sensor errors					
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value, etc.					
Number of tempoinputs	erature sensor	4					
Temperature sensor types		Pt100 (JIS, IEC) or JPt100	Sensor type, input range, and scaling to industrial units are separate for each of the 4 inputs. <b>Note</b> Sensor type, input range, and scal- ing to industrial units are set in the DM Area.				
Input ranges		<ul> <li>The input range can be set within any of the measurable input ranges shown in Table 1 (below).</li> <li>Note Internally, inputs are processed in five ranges (refer to Table 2 below), so accuracy and resolution accord with these internal ranges.</li> </ul>	Example: Sensor type: Pt100; input range: 0 to 500°C; industrial unit scaling: 0.0 to 500°C. DM Area settings are as follows: Sensor type: 0 (0000 hex) Input signal maximum: 5000 (1388 hex) Input signal minimum: 0 (0000 hex)				
Scaling in indust	rial units	Data to be stored in the allocated words in the CIO area must be scaled (individually for each of 4 inputs, with the minimum and maximum values set). Data can be stored at 0% to 100%.	Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)				
Data storage in t	he CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits					
Accuracy (25°C)		The greater of the following: $\pm 0.1\%$ (of internal range full span) or $0.1^{\circ}$ C As shown in the following equation, the accuracy depends on the ratio of the selected internal range (0 to 4) span to the set input range span.					
		Accuracy = $\pm 0.1\%$ x $\frac{\text{Internal range span}}{\text{Set input range span}}$ or 0.1°C, whichever is greater.					
Temperature coe	efficient	$\pm 0.015\%$ /°C, for any of internal range num	bers 0 to 4.				
Resolution		1/4,096 (of internal range full span) As shown in the following equation, the res- internal range (0 to 4) span to the set input	t range span.				
		Resolution = $\frac{1}{4096}$ x $\frac{\text{Internal range span}}{\text{Set input range span}}$					
Sensing method		3-wire method					
Allowable lead w	vire resistance	20 Ω max. per wire					

	Item	Specifications				
Input detection	current	0.25 mA				
Warmup time		10 min				
Response time		0.5 s (travel time from input 0% to 90%, for step input)				
Conversion per	iod	100 ms/4 inputs				
Maximum time CPU Unit	to store data in	Conversion period + one CPU Unit cycle				
Disconnection of	detection	Detects disconnections at each input and turns ON the Disconnection Detection Flag. Hardware detection time: Approx. 1 s The process value overrange direction for when a disconnection occurs can be speci- fied. (High: 115% of set input range; low: –15% of set input range)				
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 16), and stores that value in the CIO Area as the process value.				
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.				
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).				
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available				
Isolation	·	Between temperature inputs and between input terminals and PLC signals: Isolation by transformer				
Insulation resis	tance	20 M $\Omega$ (at 500 V DC) between inputs				
Dielectric stren	gth	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.				
External conne	ctions	Terminal block (detachable)				
Unit number se	ttings	Set by rotary switches on front panel, from 0 to 95.				
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Resistance Thermometer Input Unit, and errors related to the CPU Unit).				
Front panel cor	nector	Sensor input connector terminal block (detachable)				
Alarm time for CPU Unit cycle time		0.3 ms				
Current consumption		5 V DC at 150 mA max., 26 V DC at 150 mA max.				
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$				
		Note The height including the Backplane is 145 mm.				
Weight		450 g max.				
Standard acces	ssories	None				

#### Sensor Type and Input Range

The resistance thermometer type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in Table 1.

#### Table 1: Measurable Input Ranges

Sensor type	DM Area setting	Measurable input range (See note.)
Pt100	0	–200 to 850°C
JPt100	1	–200 to 500°C

**Note** Set the input range in the DM Area within this range.

Internally inputs are processed in five progressive ranges (numbers 0 to 4), as shown in the following table.

#### **Table 2: Internal Ranges**

Internal range number	Temperature range	Span
0	–200 to 850°C	1,050°C
1	–200 to 438°C	638°C

Internal range number	Temperature range	Span
2	–200 to 211°C	411°C
3	–100 to 104°C	204°C
4	–51 to 52°C	103°C

Therefore, the accuracy and resolution are determined by the ratio of the selected internal range (0 to 4) span to the set input range span. For the internal range, a larger number is selected when both the minimum and maximum values of the range fall within that next range.

For example, suppose that the sensor type is Pt100 and the set input range is -100 to  $400^{\circ}$ C. Since both the minimum and maximum values fall within the limits for internal range No. 1 (-200 to  $438^{\circ}$ C), that range will be selected.

**Note** With Resistance Thermometer Input Units, process values can be scaled (e.g., 0% to 100%) in industrial units for the set input range. It is possible to set the process value scaling higher than the resolution, but it will cause the values to be unstable.

#### **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

DM Area address		address		D	ata range	Default	Data contents

#### **Terminal Connection Diagram**

CS1W-PTS02 Isolated-type Resistance Thermometer Unit

- Note 1. Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - 2. For unused input terminals, short-circuit between A–B and B–b (e.g., A2– A3 and A3–A4 for input No. 1) of the resistance thermometer inputs with the lead wire.

#### Terminal Block Diagram

#### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or discon- nected wiring. Check whether a wiring disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The resistance thermometer input wiring is faulty.	Correct the input wiring.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Increase the number of values for calculating the moving average in mean value pro- cessing.
The process value scaling value is greater than the Unit's resolution.	Reduce the process value scaling value.
The input signal range setting is too small.	Match the input signal range to the internal ranges.

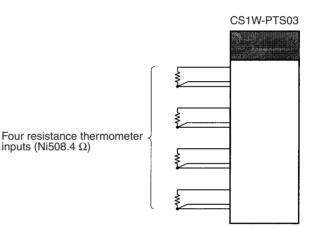

# 2-6 CS1W-PTS03 Isolated-type Resistance Thermometer Input Unit (Ni508.4)

#### <u>Overview</u>

The CS1W-PTS03 Isolated-type Resistance Thermometer Input Unit provides four direct Ni thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

## System Configuration

Features

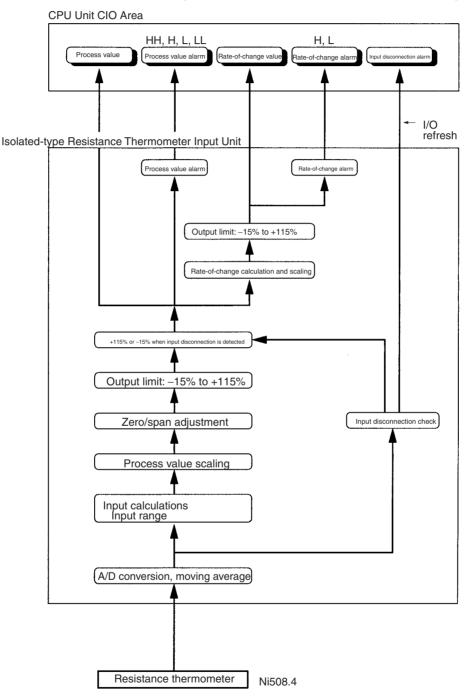

- Up to four Ni resistance thermometers can be connected for each Unit (with four separate input ranges).
- Temperature sensor values are sent to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- Maximum or minimum process value can be specified for when a disconnection is detected.

#### **Model Information**

Unit classification	Model number	Inputs	Temperature sensor types
CS-series Special I/O Unit	CS1W-PTS03	4	Resistance thermometer Ni508.4

## Block Diagram (Order of Processing)

The processing for the four inputs is as shown in the following diagram.

# **Specifications**

Item		Specifications				
Model		CS1W-PTS03				
Applicable PLC		CS Series				
Unit classification		CS-series Special I/O Unit				
Mounting position	n	CS-series CPU Rack or CS-series Expans Expansion I/O Rack or SYSMAC BUS Rer	ion Rack (Cannot be mounted to C200H note I/O Slave Rack.)			
Maximum numb	er of Units	80 (within the allowable current consumption	on and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Uni	t numbers.)			
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rat of-change alarms (L, H), disconnection alarms				
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value, etc.				
Number of temp inputs	erature sensor	4				
Temperature ser	nsor types	Ni508.4	Input range and scaling to industrial units are separate for each of the 4 inputs.			
			<b>Note</b> Sensor type, input range, and scaling to industrial units are set in the DM Area.			
Input ranges		The input range can be set within a range of –50 to 150°C (variable setting). Note Internally, inputs are processed in the above range (refer to Table 2 below), so accuracy and resolution	Example: Input range: -50 to 100°C; industrial unit scaling: -50.0 to 100.0°C. DM Area set- tings are as follows: Input signal maximum: 1000 (03E8 hex)			
Scaling in industrial units		accord with this internal range. Data to be stored in the allocated words in the CIO area must be scaled (with the minimum and maximum values set). Data can be stored at 0% to 100%.	Input signal minimum: –500 (FE0C hex) Industrial unit maximum value stored: 1000 (03E8 hex) Industrial unit minimum value stored: –500 (FE0C hex)			
Data storage in	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits				
Accuracy (25°C)		The greater of the following: ±0.2% (of internal range full span) or 0.2°C As shown in the following equation, the accuracy depends on the ratio of the selected internal range (0 to 4) span to the set input range span.				
		Accuracy = $\pm 0.1\%$ x Set input range	e span			
Temperature coe	efficient	$\pm 0.015\%$ /°C, for any of internal range num	bers 0 to 4.			
Resolution		1/4,096 (of internal range full span) As shown in the following equation, the resolution depends on the ratio of the internal range span to the set input range span. Resolution = $\frac{1}{4096}$ x $\frac{\text{Internal range span}}{\text{Set input range span}}$				
Sensing method		3-wire method				
Allowable lead w		$20 \Omega$ max. per wire				
Input detection current		0.25 mA				
Warmup time		10 min				

lt	em	Specifications				
Response time		0.5 s (travel time from input 0% to 90%, for step input)				
Conversion period		100 ms/4 inputs				
Maximum time t CPU Unit	o store data in	Conversion period + one CPU Unit cycle				
Disconnection d	letection	Detects disconnections at each input and turns ON the Disconnection Detection Flag.				
		Hardware detection time: Approx. 1 s The process value high/low direction for when a disconnection occurs can be speci- fied. (High: 115% of set input range; low: -15% of set input range)				
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 16), and stores that value in the CIO Area as the process value.				
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.				
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).				
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.				
Isolation		Between temperature inputs and between input terminals and PLC signals: Isolation by transformer				
Insulation resist	ance	20 M $\Omega$ (at 500 V DC) between inputs				
Dielectric streng	ıth	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.				
External connec	tions	Terminal block (detachable)				
Unit number set	tings	Set by rotary switches on front panel, from 0 to 95.				
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Resistance Thermometer Input Unit, and errors related to the CPU Unit).				
Front panel con	nector	Sensor input connector terminal block (detachable)				
Alarm time for CPU Unit cycle time		0.3 ms				
Current consum	ption	5 V DC at 150 mA max., 26 V DC at 150 mA max.				
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$				
		Note The height including the Backplane is 145 mm.				
Weight		450 g max.				
Standard access	sories	None				

#### Sensor Type and Input Range

The input range is set in the allocated words in the DM Area for every four inputs. It can be set anywhere within the measurable input range shown in Table 1.

#### **Measurable Input Range**

Sensor type	Measurable Input range (See note.)			
Ni508.4	–50 to 150°C			

**Note** Set the input range in the DM Area within this range.

Even if the input range is set more narrowly than the range of -50 to  $150^{\circ}$ C, internally inputs will be processed according to the internal range shown in the following table.

#### Internal range

Internal range temperatures	Internal range span		
–50 to 150°C	200°C		

Therefore, the accuracy and resolution are determined by the ratio of the internal range span to the set input range span.

Example: Even if the set input range is -50 to  $100^{\circ}$ C, internally inputs will be processed according to the internal range of -50 to  $150^{\circ}$ C.

**Note** With Resistance Thermometer Units (Ni508.4), process values can be scaled (e.g., 0% to 100%) in industrial units for the set input range. Generally, however, set the same values for process value scaling in industrial units as for the set input range. It is possible to set the process value scaling higher than the resolution, but it will cause the values to be unstable.

## **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

	DM Area	address		D	ata range	Default	Data contents	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal			
m				12345, 0	3039, 0000 hex	0000 hex	Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM words m+2 to m+93.	
							<ul> <li>12345 (3039 hex): The data in words m+2 to m+93 is transferred from the Resistance Thermometer Input Unit to the CPU Unit.</li> <li>When the transfer is completed, the value will become 0000 hex.</li> </ul>

### **Terminal Connection Diagram**

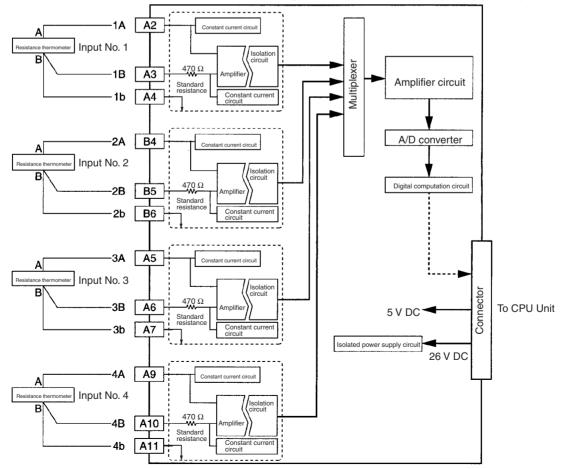

CS1W-PTS03 Isolated-type Resistance Thermometer Unit

- Note 1. Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - 2. For unused input terminals, short-circuit between A–B and B–b (e.g., A2– A3 and A3–A4 for input No. 1) of the resistance thermometer inputs with the lead wire.

### **Terminal Block Diagram**

CS1W-PTS03 Isolated-type Resistance Thermometer Input Unit (Ni508.4)

## **Error Processing**

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wiring. Check whether a wiring disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The resistance thermometer input wiring is faulty.	Correct the input wiring.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Increase the number of values for calculating the moving average in mean value pro- cessing.
The process value scaling value is greater than the Unit's resolution.	Reduce the process value scaling value.
The input signal range setting is too small.	Match the input signal range to the internal ranges.

#### CS1W-PTS12 Isolated-type Resistance Thermometer Input 2-7 Unit (Pt100, JPt100, Pt50, Ni508.4)

### **Overview**

The CS1W-PTS12 Isolated-type Resistance Thermometer Input Unit provides four direct resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

#### CS1W-PTS12

## System Configuration

	CS1W-PTS1
Four resistance thermometer inputs	
(Pt100 (JIS, IEĊ), JPt100, Pt50, or Ni508.4)	

## **Features**

• Up to four resistance thermometers can be connected for each Unit (with four separate settings for temperature sensors and input ranges).

2

- Pt100 (JIS, IEC), JPt100, Pt50, or Ni508.4 can be selected.
- 1/64,000 resolution for all temperature specifications.
- High-speed conversion of 20ms/4 inputs and 10 ms/2 inputs.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- · Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- · Maximum or minimum process value can be specified for when a disconnection is detected.
- Adjustment period control.

- Peak and bottom detection.
- Top and valley detection.

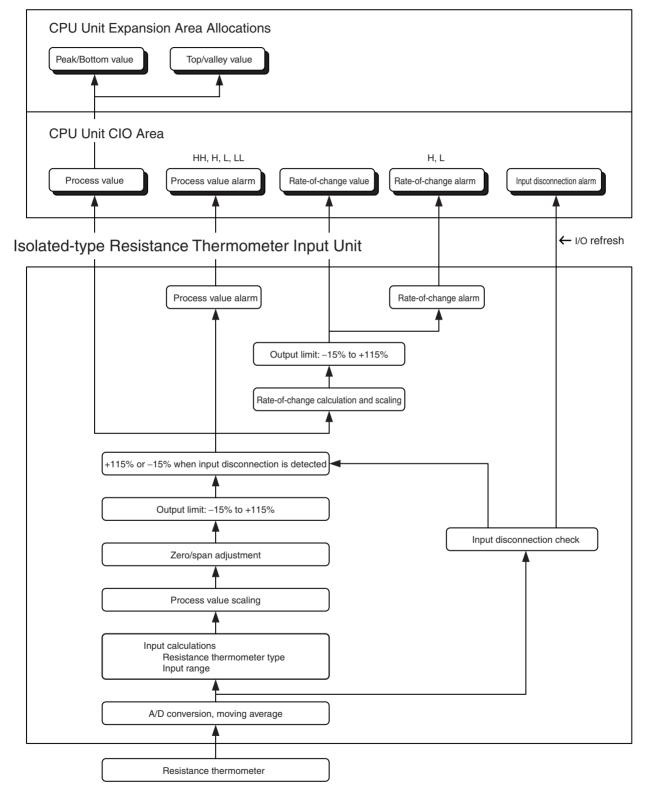

## Model Information

Unit classification	Model number	Inputs	Input types
CS-series Spe- cial I/O Unit	CS1W-PTS12	4	Resistance thermometer Pt100 (JIS, IEC), JPt100, Pt50, or Ni508.4

### Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

#### **CPU Unit**

# **Specifications**

Item		Specifications	
Model	-	CS1W-PTS12	
Applicable PLC		CS Series	
Unit classificatio	n	CS-series Special I/O Unit	
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)	
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)	
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)	
Areas for data	Special I/O Unit	10 words/Unit	
exchange with CPU Unit	Area	Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, adjustment period end/notices.	
	DM Area words	100 words/Unit	
	allocated to Special I/O Units	CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, rate-of-change input range, scaling of rate-of- change data, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value.	
	Expansion Con-	35 words/Unit	
	trol/Monitor Area words	CPU Unit to Resistance Thermometer Input Unit:	
	words	Hold function selection start/reset, adjustment period control, control bits	
		Resistance Thermometer Input Unit to CPU Unit:	
		Adjustment period warnings/notices, peak and bottom values, top and valley values	
	Expansion Set-	46 words/Unit	
	ting Area words	CPU Unit to Resistance Thermometer Input Unit:	
		Expansion Setting Area settings, adjustment period control, peak and bottom detec- tion, top and valley detection	
Number of temp inputs	erature sensor	4	
Temperature ser	nsor type	Pt100 (JIS, IEC), JPt100, Pt50, Ni508.4	
		Sensor type, input range, and scaling to industrial units are separate for each of the 4 inputs.	
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (with the minimum and maximum values set by user) (4 inputs set separately.). Data can be stored at 0% to 100%.	
Data storage in	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits	
Accuracy (25°C)	)	The greater of the following: ±0.05% or ±0.1°C	
Temperature coefficient		Pt100: 0.009%/°C JPt100: 0.01%/°C Pt50: 0.02%/°C Ni508.4: 0.012%/°C	
Resolution		1/64,000	
Sensing method		3-wire method	
Allowable lead wire resistance		20 $\Omega$ max. per wire	
Input detection current		0.5 mA	
Warmup time		10 min	
Response time		100 ms (travel time from input 0% to 90%, for step input and with moving average for 4 samples)	
Conversion perio	od	20 ms/4 inputs or 10 ms/2 inputs, selectable in DM Area words allocated to Unit as a Special I/O Unit.	

lte	em	Specifications	
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle	
Disconnection detection		Detects disconnections at each input and turns ON the Disconnection Detection Flag.	
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a disconnection occurs can be speci- fied. (High: 115% of set input range; low: -15% of set input range)	
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 128), and stores that value in the CIO Area as the process value.	
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available).	
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).	
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available, shared with process value alarm).	
	Adjustment period control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and the notice of days remaining have elapsed, this function turns ON a warning flag to give notice that it is time for readjustment.	
Peak and bot- tom detection		Detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the peak and bottom values in the Expansion Control/Monitor Area.	
	Top and valley detection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the top and valley values in the Expansion Control/Monitor Area.	
Isolation		Between temperature inputs and between input terminals and PLC signals: Power supply isolated by transformers, signals isolated by photocouplers.	
Insulation resista	ance	20 M $\Omega$ (at 500 V DC) between inputs	
Dielectric streng	th	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.	
External connec	tions	Terminal block (detachable)	
Unit number set	tings	Set by rotary switches on front panel, from 0 to 95.	
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Resistance Thermometer Input Unit, and errors detected at the CPU Unit).	
Front panel conr	nector	Sensor input connector terminal block (detachable)	
Alarm time for CPU Unit cycle time		0.3 ms	
Current consumption		5 V DC at 120 mA max., 26 V DC at 70 mA max.	
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$	
		Note The height including the Backplane is 145 mm.	
Weight		450 g max.	
Standard access	sories	None	

### Sensor Type and Input Range

The resistance thermometer type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in the following table. Accuracy and resolution, however, are not determined from the set input range, but rather from the measurable input range shown in the following table. Therefore, accuracy and resolution do not change even when a narrow input range is set.

Sensor type	DM Area setting	Measurable input range
Pt100	0	–200 to 850°C
JPt100	1	–200 to 500°C

Sensor type	DM Area setting	Measurable input range
Pt50	2	–200 to 649°C
Ni508.4	3	–50 to 150°C

## **DM Area Allocations**

First word: word m. m = D20000 + unit number × 100 (unit number: 0 to 95)

	DM Area	a address		Dat	a range	Default	Data contents
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
m				12345, 0	3039, 0000 hex	0000 hex	Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM Area words m+1 to m+93.
							<ul> <li>12345 (3039 hex): The data in words m+1 to m+93 is transferred from the Resis- tance Thermometer Input Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.</li> </ul>
							• Other than 12345 (3039 hex) (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Resistance Thermometer Input Unit.
							Number of inputs setting
m+1				0, 1	0000, 0001 hex	0	0: 4 inputs; 1: 2 inputs
	Group 1 (c it's operation		ISIY refres	hed area): Para	ameters that are cor	ntinuously refres	hed during PLC operation (regardless of the

•	ion Setting	g Area allo	ocation se		T	1		
m+98				0 to 5	0000 to 0005 hex			ng Area allocation M; 2: CIO; 3: W; 4: H; 5:
m+99				0 to 32767	0000 to 7FFF hex		First word for Ex	pansion Setting Area

Note

1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2, or in the Expansion Setting Area. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal. For more information, refer to *1-6 Error Processing*.

If the first memory address where the out-of-range error occurred is in the Expansion Setting Area, the Address of Data Range Area will be +100 or later. If the first word of the Expansion Setting Area has the error, the Address of Data Range Area will be +100.

2. When specifying an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.

Section 2-7

3. When specifying the first word in an expansion setting area, be sure that the end of the memory area is not exceeded.

### **Expansion Setting Area Allocations**

First word: word o. o = address specified in word m+99 in the area specified by word m+98 in the DM Area.

	DM Are	a address	;	Data	a range	Default	Data contents

## **Terminal Connection Diagram**

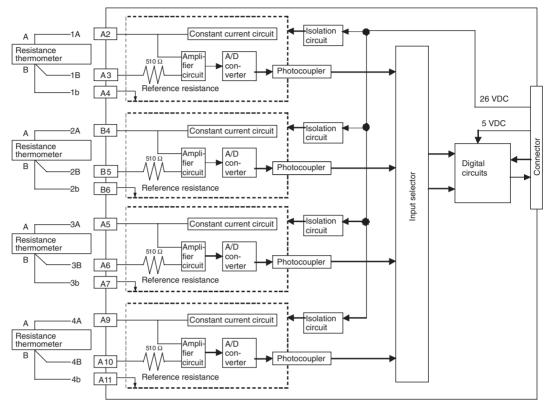

#### Note

- Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
- For unused input terminals, short-circuit between A–B and B–b (e.g., A2– A3 and A3–A4 for input No. 1) of the resistance thermometer inputs with the lead wire.
- Always ground the GR terminal on the Power Supply Unit of the PLC.

• If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

## **Terminal Block Diagram**

### Error Processing

#### **Conversion Data Does Not Change.**

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum process value scaling correctly.
The sensor type, or process value scaling is not set correctly.	Check and reset the sensor type, and the pro- cess value scaling settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, or process value scaling is set incorrectly.	Check and reset the sensor type, and the pro- cess value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The resistance thermometer input wiring is faulty.	Check and correct the input wiring.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Increase the number of values for calculating the moving average in mean value processing.
The scaling value is greater than the Unit's resolution.	Reduce the process value scaling.
The input signal range is too small.	Change to match the internal range.

Section 2-7

# 2-8 CS1W-PTS52 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)

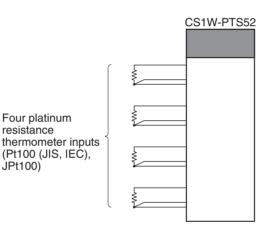

#### **Overview**

The CS1W-PTS52 Isolated-type Resistance Thermometer Input Unit provides four direct platinum resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PTS52

## **System Configuration**

### **Features**

- Up to four platinum resistance thermometers can be connected for each Unit (with four separate settings for temperature sensors and input ranges).
- Pt100 (JIS, IEC), JPt100 can be selected.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Either binary or BCD data output can be selected.)
- Process value alarm (two alarms in internal memory and one external alarm output for each input).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

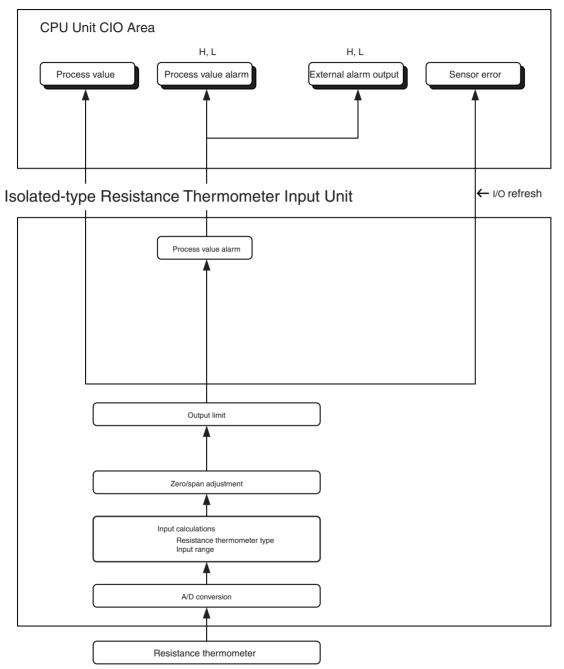

### **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Spe- cial I/O Unit	CS1W-PTS52	4	Platinum resistance thermome- ter Pt100 (JIS, IEC), JPt100

## Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

**CPU Unit** 

## **Specifications**

Item	Specifications
Model	CS1W-PTS52
Applicable PLC	CS Series
Unit classification	CS-series Special I/O Unit
Mounting position	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)
Maximum number of Units	80 (within the allowable current consumption and power consumption range)
Unit numbers	00 to 95 (Cannot duplicate Special I/O Unit numbers.)

lte	em	Specifications			
Areas for data Special I/O Unit		10 words/Unit			
exchange with CPU Unit	Area	Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flag, sensor errors.			
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.			
Number of temp inputs	erature sensor	4			
Temperature ser	nsor type	Pt100 (JIS, IEC), JPt100 The same sensor type, input range, and scaling to industrial units are used by all inputs.			
Data storage in t	the CIO Area	The actual process data in the input range is stored in four digits hexadecimal (binary or BCD values) in the allocated words in the CIO Area.			
Accuracy (25°C)		$\pm$ 0.3% of PV or $\pm$ 0.8°C, whichever is greater, $\pm$ 1 digit max. ( $\pm$ 0.3% of PV or $\pm$ 1.6°F, whichever is greater, $\pm$ 1 digit max.) PV: Process value data			
Temperature cha	aracteristics	Refer to <i>Temperature Characteristics According to Platinum Resistance Thermometer Type</i> on page 151.			
Sensing method		3-wire method			
Influence of cone	ductor resistance	0.4°C/Ω max.			
Conversion perio	bd	250 ms/4 inputs			
Warmup time		10 min			
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle			
Sensor error det	ection	Detects sensor error at each input and turns ON the Sensor error Flag. Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: +20 digit of set input range; low: -20 digit of set input range)			
Function	Process value alarm	Process value 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available).			
	External alarm outputs	NPN outputs (with short-circuit protection) External power supply voltage: 20.4 to 26.4 V DC Max. switching capacity: 100 mA (for one output) Leakage current: 0.3 mA max. Residual voltage: 3 V max.			
Isolation		Between inputs and PLC signal: Transformer for power supply and photocoupler for signals			
Insulation resista	ance	Between each input: Transformer for power supply and photocoupler for signals 20 M $\Omega$ max. (at 500 V DC).			
		Between all output and NC terminals and external AC terminals (Power Supply Ur Between all input terminals and external AC terminals (Power Supply Unit) Between all input terminals and all output terminals Between all external DC terminals (input, output, and NC terminals) and FG plate Between all input and output terminals and all NC terminals			
Dielectric strength		Between all output and NC terminals and external AC terminals (Power Supply Unit) 2,000 V AC, 50/60 Hz 1 min., detection current: 1 mA Between all input terminals and external AC terminals (Power Supply Unit) Between all input terminals and all output terminals Between all external DC terminals (input, output, and NC terminals) and FG plate 1,000 V AC, 50/60 Hz 1 min., detection current: 1 mA Between all channels			
		500 VAC, 50/60 Hz 1 min., detection current: 1mA			

Item	Specifications
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Seven LED indicators on front panel (for normal operation, errors detected at the Unit, errors detected at the CPU Unit, and four indicators for external alarm outputs.)
Alarm time for CPU Unit cycle time	0.4 ms
Current consumption	5 V DC at 250 mA max
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.

#### Sensor Type and Input Range

The Platinum Resistance Thermometer type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input		°C		°F		
ting		16-bit binary	BC	D	16-bit binary	B	CD
			F indicates minus sign.	Leftmost bit indicates minus sign.		Leftmost 4 bits (bits 12 to 15) indicate minus sign.	Leftmost bit (bit 15) indicates minus sign.
0	Pt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	F830 to FFFF to 1964 (-200.0 to -0.1 to 650.0)	F999 to 6500 (See note 2.) (–99.9 to 650.0)		F448 to FFFF to 2EE0 (–300.0 to –0.1 to 1200.0)	F999 to 9999 (See note 2.) (–99.9 to 999.9)	B000 to 7999 (See note 2.) (–300.0 to 799.9)
1	JPt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	F830 to FFFF to 1964 (-200.0 to -0.1 to 650.0)	F999 to 6500 (See note 2.) (–99.9 to 650.0)		F448 to FFFF to 2EE0 (–300.0 to –0.1 to 1200.0)	F999 to 9999 (See note 2.) (–99.9 to 999.9)	B000 to 7999 (See note 2.) (–300.0 to 799.9)
2 to 9	Do not set.	•	·	•	Do not set.	·	•

- Note 1. If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.
  - The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs. For 0.1°C/0.1°F indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9. For 0.1°C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

### **Temperature Characteristics According to Platinum Resistance Thermometer Type**

Platinum Resistance Thermometer	Temperature range	Set value error when ambient temperature changes by 1°C
Pt100	–200 to 200°C	±0.06°C
	200 to 650°C	285 ppm of PV
JPt100	–200 to 200°C	±0.06°C
	200 to 650°C	285 ppm of PV

The measured temperature error is calculated as shown in the following example.

Item	Details
Ambient temperature	30°C
Platinum Resistance Thermometer	Pt100
Measured temperature (PV)	500°C
Reference accuracy (25°C)	$\pm 0.3^{\circ}$ C of PV or $\pm 0.8^{\circ}$ C, whichever is greater, $\pm 1$ digit. In this example, $\pm 1.5^{\circ}$ C.
Temperature characteris- tics	200 to 650°C: 285 ppm of PV. In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient tem- perature	5°C (25 to 30°C)

Overall accuracy =

Reference accuracy + Temperature characteristic × Change in ambient temperature =  $\pm 1.5^{\circ}$ C +  $\pm 0.143^{\circ}$ C × 5 = Approx.  $\pm 2.2^{\circ}$ C  $\pm 1$  digit.

## **DM Area Allocations**

First word: word m.  $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

DM Area address		Data	a range	Default	Data contents		
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
m				12345, 0	3039, 0000 hex	0000 hex	Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM Area words m+1 to m+93.
							• 12345 (3039 hex): The data in words m+1 to m+93 is transferred from the Resis- tance Thermometer Input Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.
							Other than 12345 (3039 hex) (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Resistance Thermometer Input Unit.
Display p	paramete	r			•	•	
m + 1				0 to 34	0000 to 0022 hex	0 (0000 hex)	Address of Data Range Error (See note1.)

							Process value alarm settings
m + 2	m + 6	m + 10	m + 14	Low to high limit for all sensors		6500 (1964 hex)	Process value H (high limit) alarm setting
m + 3	m + 7	m + 11	m + 15			–2000 (F830 hex)	Process value L (low limit) alarm setting
							Span adjustment value

### CS1W-PTS52 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100) Section 2-8

DM Area address		Data	range	Default	Data contents		
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
m + 4	m + 8	m + 12	m + 16	0 to 9999	0000 to270F hex	1000 (03EB hex)	m+35 contains 0: Set value $\times$ 0.001
				0 to 32000	0000 to 7D00 hex	10000 (2710 hex)	m+35 contains 1: Set value $\times$ 0.0001
							Zero adjustment value
m + 5	m + 9	m + 13	m + 17	-9999 to 9999	D8F1 to 270F hex,	0 (0000 hex)	Set value × 0.1
Setting Input Un	Group 2 (i it if word m	<b>nitial sett</b> i contains	ings area) other than	Parameters tha 12345 when the	t are transferred o PLC is turned ON	ne time from the I or the Resistanc	CPU Unit to the Resistance Thermometer the Thermometer Input Unit is restarted.
							Operation settings (See note 2.)
m + 18				(See note 2.)	(See note 2.)	0 (0000 hex)	00 to 03: Temperature unit (°C or °F) 04 to 07: Data display (binary or BCD) 08 to 11: Minus sign display format for BCD display 12 to 15: Data direction at sensor error
						•	Sensor type
m + 19	m + 23	m + 27	m + 31	0 to 1	0000, 0001 hex	0 (0000 hex)	0: Pt100; 1: JPt100
						1	External alarm output mode
m + 20	m + 24	m + 28	m + 32	0, 1	0000, 0001 hex	0 (0000 hex)	Select either high limit or low limit alarm out- put. 0: High limit alarm; 1: Low limit alarm
						1	Alarm hysteresis
m + 21	m + 25	m + 29	m + 33	0 to 9999	0000 to 270F hex	0 (0000 hex)	Set value × 0.1
				•		•	Alarm ON-delay time
m + 22	m + 26	m + 30	m + 34	0 to 60	0000 to 003C hex	0 (0000 hex)	Unit: s
m+35	•			0, 1	0000, 0001 hex	1 (See note 3.)	Span adjustment mode 0: 1/1,000 1: 1/10,000

 Note 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

2. The operation settings are shown in the following table.

Word	Bits	Description	Settings
m+18	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

Example:

For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 contains 1000.

3. Indicates the value after transferring the default value (set when 12345 is written to word m).

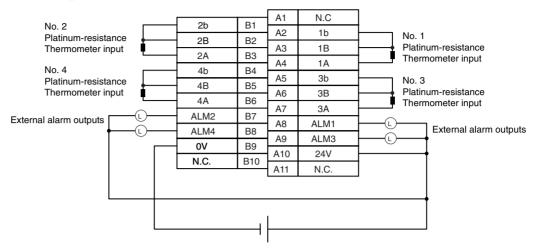

## **<u>CIO Area Allocations</u>**

		03	Input No. 4		0, 1	
		04 to 14	Not used.			
		15	15	Conversion data enabled flag (See note.)	0, 1	0: Data disabled 1: Data enabled

First word: word n. n = 2000 + unit number  $\times$  10 (unit number: 0 to 95)

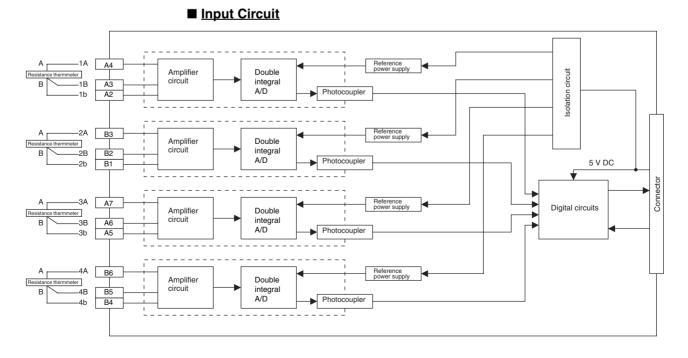

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

### **Terminal Connection Diagram**

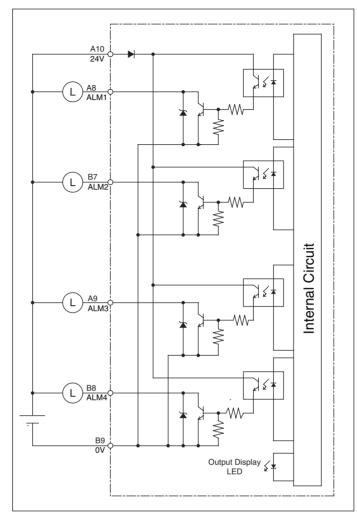

Note

- Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - For unused input terminals, connect approximately 100  $\Omega$  between the platinum-resistance thermometer input terminals A and B and short terminals B and b with a lead wire. If resistance is not connected between terminals A and B and terminals B and b are shorted or if terminals A and B and terminals B and b are left open, the alarm output will turn ON and the ALM indicator will light.
  - Do not connect anything to NC terminals. Do not use NC terminals as relay terminals.
  - Always ground the GR terminal on the Power Supply Unit of the PLC.
  - If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

#### Terminal Block Diagram

#### ■ Output Circuit

## Error Processing

Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The sensor type is not set cor- rectly.	Check and reset the sensor type.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the resistance has changed. Check for faulty or disconnected wiring. Check whether a sensor error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type is set incorrectly.	Check and reset the sensor type.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.

Probable cause	Remedy
The platinum-resistance thermom- eter input wiring is faulty.	Check and correct the input wiring.
The compensating conductor is too long and measurements are being affected by conductor resistance.	Use a thicker compensating conductor.

#### Converted Values are Unstable.

Probable cause	Remedy
external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)

# 2-9 CS1W-PTS56 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)

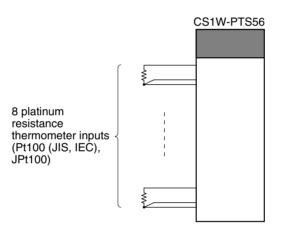

#### **Overview**

The CS1W-PTS56 Isolated-type Resistance Thermometer Input Unit provides 8 direct platinum resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PTS56

## **System Configuration**

### Features

- Up to 8 platinum resistance thermometers can be connected for each Unit (with 8 separate settings for temperature sensors and input ranges).
- Pt100 (JIS, IEC), JPt100 can be selected.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Either binary or BCD data output can be selected.)
- Process value alarms (Two internal alarms per input can be output to memory and two alarms per input can be output to specified I/O memory area addresses using indirect address specifications).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

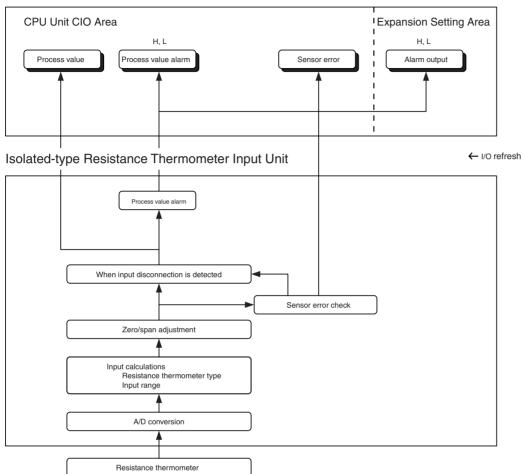

#### **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Spe- cial I/O Unit	CS1W-PTS56	-	Platinum resistance thermome- ter Pt100 (JIS, IEC), JPt100

### **Block Diagram (Order of Processing)**

The processing for the inputs is as shown in the following diagram.

**CPU Unit** 

### **Specifications**

lt	em	Specifications			
Model		CS1W-PTS56			
Applicable PLC		CS Series			
Unit classification	n	CS-series Special I/O Unit			
Mounting position	on	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)			
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data	Special I/O Unit	10 words/Unit			
exchange with CPU Unit	Area	Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flag, sensor errors.			
	DM Area words	100 words/Unit			
	allocated to Special I/O Units	CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.

#### Sensor Type and Input Range

The Platinum Resistance Thermometer type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input		°C		°F			
ting		16-bit binary	BC	D	16-bit binary	BC	CD	
			F indicates minus sign.	Leftmost bit indicates minus sign.		Leftmost 4 bits (bits 12 to 15) indicate minus sign.	Leftmost bit (bit 15) indicates minus sign.	
0	Pt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	1964 (–200.0 to	(See note 2.)		2EE0 (–300.0 to		B000 to 7999 (See note 2.) (-300.0 to 799.9)	
1	JPt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	1964 (–200.0 to	(See note 2.)		2EE0 (–300.0 to		B000 to 7999 (See note 2.) (-300.0 to 799.9)	
2 to 9	Do not set.				Do not set.			

If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.

2. The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs.

For  $0.1^{\circ}C/0.1^{\circ}F$  indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9.

For  $0.1^{\circ}$ C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

#### **Temperature Characteristics According to Platinum Resistance Thermometer Type**

Platinum Resistance Thermometer	Temperature range	Set value error when ambient temperature changes by 1°C	
Pt100	–200 to 200°C	±0.06°C	
	200 to 650°C	285 ppm of PV	
JPt100	–200 to 200°C	±0.06°C	
	200 to 650°C	285 ppm of PV	

The measured temperature error is calculated as shown in the following example.

Item	Details
Ambient temperature	30°C
Platinum Resistance Thermometer	Pt100
Measured temperature (PV)	500°C
Reference accuracy	$\pm 0.3^{\circ}$ C of PV or $\pm 0.8^{\circ}$ C, whichever is greater, $\pm 1$ digit.
(25°C)	In this example, $\pm 1.5^{\circ}$ C.
Temperature characteris-	200 to 650°C: 285 ppm of PV.
tics	In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient tem- perature	5°C (25 to 30°C)

Overall accuracy =

Reference accuracy + Temperature characteristic × Change in ambient temperature =  $\pm 1.5^{\circ}$ C +  $\pm 0.143^{\circ}$ C × 5 = Approx.  $\pm 2.2^{\circ}$ C  $\pm 1$  digit.

m+59								0, 1	0000, 0001 hex	0 (0000 hex)	0: Disabled 1: Enabled

DM Area address								Data range		Default	Data contents
Input         Input <th< th=""><th></th><th>Hexadeci- mal</th><th></th><th></th></th<>					Hexadeci- mal						
											Expansion Setting Area address
m+60 (See note 3)						0 to 6143	0000 to 17FF hex	0 (0000 hex)	CIO area (fixed) Number of words.		

 Note
 The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

- 2. The operation settings are shown in the following table.
- 3. A range check is not performed for the Expansion Setting Area address set in word m+60. Be sure to check this address before starting actual operation.

Word	Bits	Description	Settings
m+18	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 contains 1000.

### **Expansion Setting Area**

Direction	Word	Bit	1	Name	Data range	Contents	
Resistance Thermometer	0	00	Input No. 1	Process value L (low limit) alarm	0, 1	0: Process value > Set value 1: Process value $\leq$ Set value

First word: word o. (o = address specified in word m+60 in the DM Area)

**Note** If either of the following changes is made for the Expansion Setting Area for the CS1W-PTS55/PTS56/PDC55, the previous data will be left in the Expansion Setting Area even after the change has been made. Clear the previous data when changing either of these settings.

- The Expansion Setting Area Enable setting is changed from "enabled" to "disabled."
- The Expansion Setting Area Address setting is changed while the Expansion Setting Area Enable setting is set to "enabled."

				enabled flag (See note.)	U, I	0: Data disabled 1: Data enabled

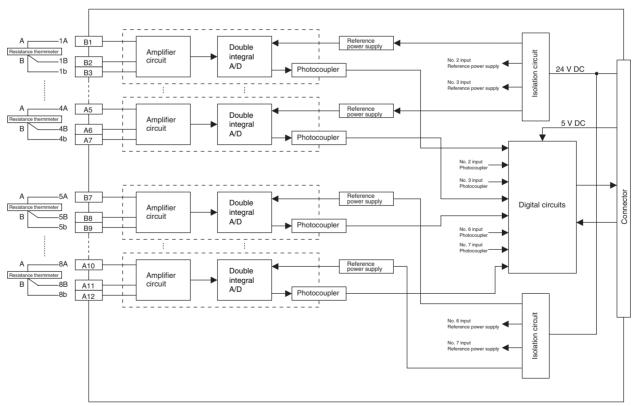

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

#### **Terminal Connection Diagram**

- Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - Set the *Sensor type* in Setting Group 2 in the DM Area to "Not used" for any thermocouple inputs that are not used.
  - Always ground the GR terminal on the Power Supply Unit of the PLC.
  - If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

### **Terminal Block Diagram**

#### Input Circuit

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The sensor type is not set cor- rectly.	Check and reset the sensor type.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the resistance has changed. Check for faulty or disconnected wiring. Check whether a sensor error has been detected in the I/O Area.

Section 2-9

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, or input range is set incorrectly.	Check and reset the sensor type, input range, and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The platinum-resistance thermom- eter input wiring is faulty.	Check and correct the input wiring.
The compensating conductor is too long and measurements are being affected by conductor resistance.	Use a thicker compensating conductor.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)

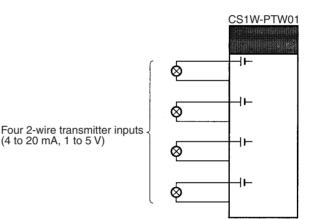

# 2-10 CS1W-PTW01 2-Wire Transmitter Input Unit

## **Overview**

The CS1W-PTW01 2-Wire Transmitter Input Unit provides up to four inputs for unified signals (4 to 20 mA) from a transmitter, with no external DC power supply, and sends the data to the CPU Unit each cycle.

## System Configuration

## Features

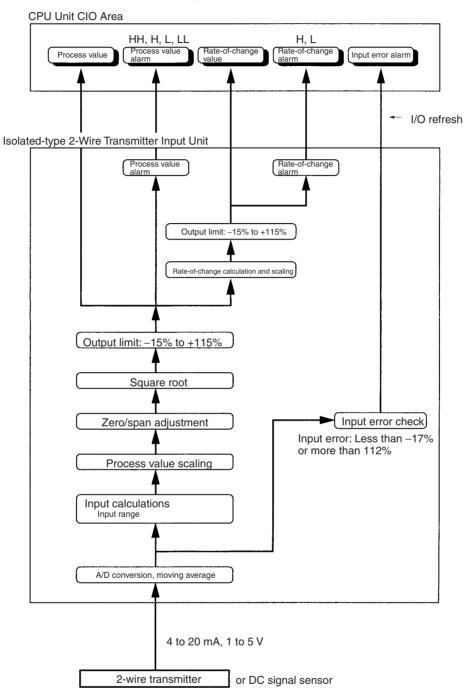

- Up to four inputs can be connected per Unit for unified signals from a 2wire transmitter, such as pressure, differential pressure, etc.
- A built-in power supply (24 V DC) for a 2-wire transmitter for each input eliminates the need for an external power supply.
- Inputs of 4 to 20 mA and 1 to 5 V, are possible with no need to provide the usual DC power supply.
- Scaling values are sent to the CPU Unit in four digits hexadecimal.
- Square root function.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Input error detection.
- Zero/span adjustment capability during operation.

## **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PTW01	4	From transmitter: unified signal (4 to 20 mA) or 4 to 20 mA, 1 to 5 V

## Block Diagram (Order of Processing)

The processing for the four inputs is as shown in the following diagram.

## **Specifications**

Item	Specifications				
Model	CS1W-PTW01				
Applicable PLC	CS Series				
Unit classification	CS-series Special I/O Unit				
Mounting position	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)				
Maximum number of Units	80 (within the allowable current consumption and power consumption range)				
Unit numbers	00 to 95 (Cannot duplicate Special I/O Unit numbers.)				

It	tem	Specifi	cations			
Areas for data	Special I/O Unit	10 words/Unit				
exchange with CPU Unit	Area	2-Wire Transmitter Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate-of- change alarms (L, H), input errors				
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to 2-Wire Transmitter Input Unit: Sensor type, scaling of process value data to be stored in allocated words in CIO area, square root function enable, rate-of-change value range, rate-of-change scaling, num- ber of items for moving average, process value alarm setting (LL, L, H, HH), rate-of- change alarm setting (L, H), zero/span adjustment value, etc.				
Number of inpu	its	4				
Sensor type		Unified signal from transmitter (4 to 20 mA), 4 to 20 mA, 1 to 5 V	Sensor type and scaling to industrial units are separate for each of the 4 inputs.			
User-defined so units	caling in industrial	Scaling required for 4 to 20 mA or 1 to 5 V. (Any minimum and maximum values can be set.) (4 inputs set separately.)	<b>Note</b> Sensor type and scaling to industrial units are set in the DM Area. Example:			
Data storage in the CIO Area		The value derived from carrying out the following processing in order of the process value data is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Square root extraction $\rightarrow$ 5) Output limits	Input signal type: 4 to 20 mA from 2-wire transmitter; industrial unit scaling: 0 to 500 m <sup>3</sup> /h (after square root extraction). DM Area settings are as follows: Input signal type: 0 (0000 hex) Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)			
Accuracy (25°C	2)	±0.2% of full scale				
Temperature co	pefficient	±0.015%/°C of full scale				
Resolution		1/4,096 of full scale				
Input signal ran	ige	-15 to 115%				
Power supply for ter	or 2-wire transmit-	Output voltage: 24 V DC ±15% for each input (without load) Current capacity: 22 mA max. for each input Short-circuit control current: 22 to 27 mA Allowable short-circuit time: Ambient temperature less than 40°C: No limit Ambient temperature 40 to 55°C: 10 min or less				
Input impedance	e	4 to 20 mA for 2-wire transmitter: 250 $\Omega$ ; 4	to 20 mA: 250 Ω; 1 to 5 V: 1 MΩ min.			
Warmup time		10 min				
Response time		0.5 s (travel time from input 0% to 90%, for	step input)			
Conversion per	iod	100 ms/4 inputs				
Maximum time CPU Unit	to store data in	Conversion period + one CPU Unit cycle				
Input error detection		Error detected when under –17.2% (4 to 20 mA: 1.25 mA; 1 to 5 V: 0.3125 V) or over 112.5% (4 to 20 mA: 22 mA; 1 to 5 V: 5.5 V).				
Operation at in	put disconnection	Process value of -15% stored.				
Input disconnectime	ction overrange	Approx. 1 s				

	ltem	Specifications					
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 16), and stores that value in the CIO Area as the process value.					
	Process value alarm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.					
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).					
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.					
	Square root	When the process value scaling maximum value is A and the minimum value is B:					
		Output = $\sqrt{(A-B)(Input-B)} + B$					
		Dropout: Output approx. 7% maximum linear (output = input) characteristics					
		<b>Note 1</b> The square root function is only enabled when the maximum scaling value is greater than the minimum value.					
		<b>Note 2</b> When square root processing is being performed, set the maximum and minimum scaling values to the values required after square root processing of the current or other input values.					
Isolation		Between inputs and between input terminals and PLC signals: Isolation by transformer					
Insulation re	sistance	20 MΩ (at 500 V DC) between inputs					
Dielectric str	ength	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.					
External con	inections	Terminal block (detachable)					
Unit number	settings	Set by rotary switches on front panel, from 0 to 95.					
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the 2- Wire Transmitter Input Unit, and errors related to the CPU Unit).					
Front panel of	connector	Sensor input connector terminal block (detachable)					
Alarm time for time	or CPU Unit cycle	0.3 ms					
Current consumption		5 V DC at 150 mA max., 26 V DC at 160 mA max.					
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$					
		Note The height including the Backplane is 145 mm.					
Weight		450 g max.					
Standard ac	cessories	None

#### **Terminal Block Diagram**

## Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage has changed. Check for faulty or disconnected wiring. Check whether an input error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The square root function is oper- ating.	Set the square function so that it does not operate.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the I+ and COM, and between the V+ and COM input terminals.
	Increase the number of values for calculating the moving average in mean value pro- cessing.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

# 2-11 CS1W-PDC01 Isolated-type Direct Current Input Unit

### **Overview**

The CS1W-PDC01 Isolated-type Direct Current Input Unit provides four DC signal inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

# **System Configuration**

Four DC inputs (-10 to 10 V, 0 to 10 V, -5 to 5 V, 0 to 5 V, 1 to 5 V, user-set V range, 4 to 20 mA, 0 to 20 mA)

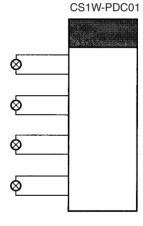

**Features** 

- Up to four DC signal inputs can be connected per Unit. Any of the following can be selected separately for the four inputs: 4 to 20 mA, 0 to 20 mA, -10 to 10 V, 0 to 10 V, -5 to 5 V, 1 to 5 V, 0 to 5 V, or  $\pm 10$ -V user-set range.
- Scaling values are sent to the CPU Unit in four digits hexadecimal.
- · Isolation between analog inputs can prevent sneak circuits from occurring between input signals.
- Square root function.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Input error detection.
- · Zero/span adjustment capability during operation.

### **Model Information**

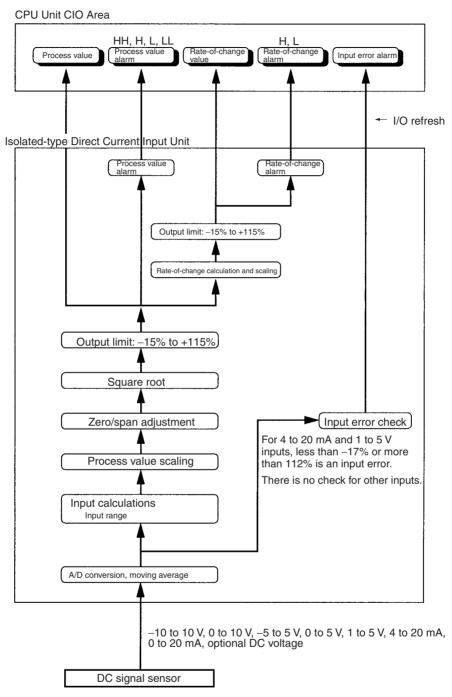

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PDC01		The following can be selected separately: 4 to 20 mA, 0 to 20 mA, $-10$ to 10 V, 0 to 10 V, $-5$ to 5 V, 1 to 5 V, 0 to 5 V, or $\pm10\text{-V}$ user-set range

### **Block Diagram (Order of Processing)**

The processing for the four inputs is as shown in the following diagram.

# **Specifications**

	allocated to Special I/O Units	CPU Unit to Isolated-type Direct Current Input Unit: Input signal type, scaling of process values in industrial units, square root function enable, rate-of-change value range, rate-of-change scaling, number of items for mov- ing average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value, etc.					
Number of input	S	4					
Input signal type	2	4 to 20 mA, 0 to 20 mA, $-10$ to 10 V, 0 to 10 V, $-5$ to 5 V, 1 to 5 V, 0 to 5 V, or $\pm 10$ -V user-set range. The $\pm 10$ -V user-set range can be specified within $-10.000$ to 10.000 V.	Input signal type and scaling to industrial units are separate for each of the 4 inputs. <b>Note</b> Input signal type and scaling to industrial units are set in the DM Area.				
User-defined sca units	aling in industrial	Scaling required for the above input sig- nals, such as 4 to 20 mA or 1 to 5 V. (Any minimum and maximum values can be set.) (4 inputs set separately.)	Example: Input signal type: 4 to 20 mA; industrial unit scaling: 0 to 500 m <sup>3</sup> /h (after square root extraction). DM Area settings are as				
Data storage in the CIO Area		The value derived from carrying out the following processing in order of the process value data is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Square root extraction $\rightarrow$ 5) Output limits	follows: Input signal type: 5 (0005 hex) Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)				
Accuracy (25°C)		$\pm 0.1\%$ of full scale For the $\pm 10$ -V user-set range, however, as shown in the following equation, the accuracy depends on the ratio of the selected internal range (0 to 4) span to the user-set range span.					
		Accuracy = $\pm 0.1\%$ x $\frac{\text{Internal range span}}{\text{User-set range span}}$					
Temperature coe	efficient	±0.015% /°C with respect to full scale. For the ±10-V user-set range, however: ±0.015% /°C with respect to the internal range.					
Resolution		1/4,096 of full scale For the $\pm 10$ -V user-set range, however, as shown in the following equation, the resolu- tion depends on the ratio of the selected internal range (0 to 4) span to the user-set range span. Resolution = $\frac{1}{4096}$ x $\frac{\text{Internal range span}}{\text{User-set range span}}$					
Input signal rang	je	For inputs of 4 to 20 mA, 0 to 20 mA, 0 to 10 V, 1 to 5 V, 0 to 5 V: $-15$ to $115\%$ For inputs of $-10$ to 10 V or $-5$ to 5 V: $-7.5$ to $107.5\%$ For $\pm 10$ -V user-set range: $-7.5$ to $107.5\%$ of internal range					
Input impedance	9	For current input: 250 $\Omega$ For voltage input: 1 M $\Omega$ min.	č				

lte	em	Specifications				
Warmup time		10 min				
Response time		0.5 s (travel time from input 0% to 90%, for step input)				
Conversion perio	bd	100 ms/4 inputs				
Maximum time to store data in CPU Unit		Conversion period + one CPU Unit cycle				
Input error detec	tion	Checks are conducted for only 4 to 20 mA and 1 to 5 V. Error detected when under –17.2% (1.25 mA, 0.3125 V) or over 112.5% (22 mA, 5.5 V).				
Operation at inpu	ut disconnection	4 to 20 mA, 1 to 5 V: Process value of $-15\%$ stored. 0 to 20 mA, 0 to 5 V, 0 to 10 V, $-10$ to 10 V: The same value is stored as when 0 V or 0 mA is input.				
Input disconnect time	ion overrange	Approx. 1 s				
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of past process values (1 to 16), and stores that value in the CIO Area as the process value.				
	Process value alarm	Process value 4-point alarm (HH, H, L, LL), hysteresis, and ON-delay timer (0 to 60 s) are available.				
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).				
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.				
	Square root	When the process value scaling maximum value is A and the minimum value is B: Output = $\sqrt{(A-B)(Input-B)} + B$				
		Dropout: Output approx. 7% maximum linear (output = input) characteristics				
		<b>Note</b> The square root function is only enabled when the maximum scaling value is greater than the minimum value.				
		<b>Note</b> When square root processing is being performed, set the maximum and minimum scaling values to the values required after square root processing of the current or other input values.				
Isolation		Between analog inputs and between input terminals and PLC signals: Isolation by transformer				
Insulation resista	ance	20 M $\Omega$ (at 500 V DC) between inputs				
Dielectric strengt	th	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.				
External connect	tions	Terminal block (detachable)				
Unit number sett	ings	Set by rotary switches on front panel, from 0 to 95.				
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Direct Current Input Unit, and errors related to the CPU Unit).				
Front panel connector		Sensor input connector terminal block (detachable)				
Alarm time for CPU Unit cycle time		0.3 ms				
Current consump	otion	5 V DC at 150 mA max., 26 V DC at 160 mA max.				
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$				
		Note The height including the Backplane is 145 mm.				
Weight		450 g max.				
Standard access	sories	None				

## Accuracy and Resolution for ±10V User-set Range

With the  $\pm 10\text{-V}$  user-set range, the input signal zero and span can be set anywhere within the range -10.000 to 10.000 V. Internally, however, inputs are processed in five progressive ranges (numbers 0 to 4), as shown in the following table.

#### **Table 1: Internal Ranges**

Internal range number	Measurable voltage	Internal range span
0	-10.000 to 10.000 V	20.000 V
1	-5.000 to 5.000 V	10.000 V
2	-2.500 to 2.500 V	5.000 V
3	-1.250 to 1.250 V	2.500 V
4	-0.625 to 0.625 V	1.250 V

Therefore, the accuracy and resolution of the set range span are determined by the ratio of the internal range (0 to 4) span to the set input range span. For the internal range, a larger number is selected when both the minimum and maximum values of the range fall within that next range.

For example, suppose that the set input range is 0.000 to 3.000 V. Since both the minimum and maximum values fall within the limits for internal range No. 1 (-5.000 to 5.000 V), that range will be selected.

### **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

#### **Terminal Connection Diagram**

**Note** In both of the above cases, leave all unused inputs open between the positive and negative terminals (e.g., between B1 and B2 for voltage input No. 1).

### **Terminal Block Diagram**

## Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage has changed. Check for faulty or disconnected wiring. Check whether an input error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The square root function is oper- ating.	Set the square function so that it does not operate.

#### Converted Values are Unstable.

Probable cause	Remedy				
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)				
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the I+ and COM, and between the V+ and COM input terminals.				
	Increase the number of values for calculating the moving average in mean value pro- cessing.				
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.				

# 2-12 CS1W-PDC11 Isolated-type Direct Current Input Unit

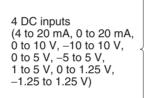

#### **Overview**

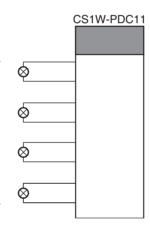

The CS1W-PDC11 Isolated-type Direct Current Input Unit provides four direct-current inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PDC11

## System Configuration

## **Features**

- Up to four DC inputs can be made to each Unit. 4 to 20 mA, 0 to 20 mA, 0 to 10 V, -10 to 10 V, 0 to 5 V, -5 to 5 V, 1 to 5 V, 0 to 1.25 V, or -1.25 to 1.25 V can be selected separately for each input.
- Resolution of 1/64,000 for all input range specifications.
- High-speed conversion, at 20 ms/4 inputs and 10 ms/2 inputs.
- Scaling values are transmitted to the CPU Unit in four digits hexadecimal.
- There is isolation between channels, so unwanted signal paths between input signals can be prevented.
- Square root function.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Input error detection.
- Zero/span adjustment capability during operation.
- Adjustment period control.
- Peak and bottom detection.
- Top and valley detection.

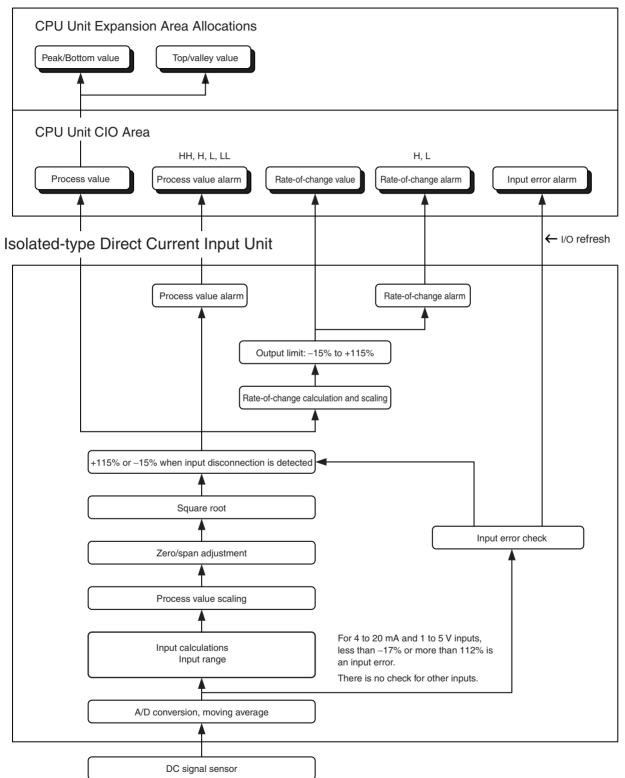

• Integral value calculation.

# Model Information

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PDC11		4 to 20 mA, 0 to 20 mA, 0 to 10 V, -10 to 10 V, 0 to 5 V, -5 to 5 V, 1 to 5 V, 0 to 1.25 V, and -1.25 to 1.25 V (separate for each input)

## Block Diagram

CPU Unit

# **Specifications**

lt	em	Specifications				
Model		CS1W-PDC11				
Applicable PLC		CS Series				
Unit classificatio	'n	CS-series Special I/O Unit				
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)				
Maximum numb	er of Units	80 (within the allowable current consumption and power consumption range)				
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)				
Areas for data	Special I/O Unit	10 words/Unit				
exchange with CPU Unit	Area	Isolated-type Direct Current Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, cold junction sensor errors, adjust- ment period end/notice				
	DM Area words	100 words/Unit				
	allocated to Special I/O Units	CPU Unit to Isolated-type Direct Current Input Unit: Input signal type, scaling of process value in industrial units, process value alarm set- ting (L, H), inrush input upper limit, inrush input upper limit time, zero/span adjustment value, Square root function.				
		Temperature input signal type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, rate-of-change input range, scaling of rate-of-change data, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value				
	Expansion Con-	35 words/Unit				
	trol/Monitor Area	CPU Unit to Isolated-type Direct Current Input Unit:				
		Bits for beginning or resetting the hold function selection, adjustment period control, control bits				
		Isolated-type Direct Current Input Unit to CPU Unit:				
		Adjustment period notices, peak and bottom values, top and valley values, integral values				
	Expansion Set-	46 words/Unit				
	ting Area	CPU Unit to Isolated-type Direct Current Input Unit:				
		Expansion Setting Area settings, adjustment period control, peak and bottom detec- tion, top and valley detection, integral value calculation				
Number of input		4				
Input signal type	)	4 to 20 mA, 0 to 20 mA, 0 to 10 V, $-10$ to 10 V, 0 to 5 V, $-5$ to 5 V, 1 to 5 V, 0 to 1.25 V, $-1.25$ to 1.25 V (separate for each input), and $\pm 10$ -V user-set range (specified range within $-10.000$ V to 10.000 V)				
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (Any mini- mum and maximum values can be set.) (4 inputs set separately.) Data can be con- verted at 0% to 100%.				
Data storage in the CIO Area		The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Square root calculation $\rightarrow$ 5) Output limits				
Accuracy (25°C)		±0.05%				
Temperature coefficient		±0.008%/°C				
Resolution		1/64,000				
Input signal rang	ge	For 4 to 20 mA, 0 to 20 mA, 0 to 10 V, 0 to 5 V, 1 to 5 V, 0 to 1.25 V inputs: -15 to 115%				
		For –10 to 10 V, –5 to 5 V, –1.25 to 1.25 V inputs: –7.5 to 107.5%				

Item		Specifications				
Input impedan	се	For current inputs: 250 $\Omega$ (typical)				
		For voltage inputs: 1 M $\Omega$ min.				
Warmup time		10 min				
Response time		100 ms (travel time from input 0% to 90%, for $\pm 10$ V step input and with moving average for 4 samples)				
Conversion pe	riod	20 ms/4 inputs, 10 ms/2 inputs, selectable in words allocated to the Unit as a Special I/O Unit.				
Maximum time CPU Unit	to store data in	Conversion period + one CPU Unit cycle				
Input error det	ection	Check only for 4 to 20 mA and 1 to 5 V.				
		Error detected for –17.2% (1.25 mA, 0.3125 V) or less and 112.5% (22 mA, 5.5 V) or more.				
Operation at in	put disconnection	For 4 to 20 mA and 1 to 5 V: Stores –15% process value. For all other ranges: Stores same process value as 0-V or 0-mA inputs.				
Input disconne delay time	ection detection	Approx. 1 s.				
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the past specified number of process values (1 to 128 can be specified), and stores that value in the CIO Area as the process value.				
	Process value alarm	Process value 4-point alarm (LL, L H, HH), hysteresis, and ON-delay timer (0 to 60 s) are available.				
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).				
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available, shared with process value alarm).				
	Square root cal- culation	When the maximum value for process value scaling is A and the minimum value is B, $\sqrt{(A - B)} = 0$				
		$\sqrt{(A-B)} \times (input - B) + B$				
		Drop-out: Output approx. 7% max. linear (output = input) characteristic				
		Note 1 The square root function can only be used when the maximum scaling value is greater than the minimum scaling value. The square root will not be found in the maximum is smaller than the minimum.				
		<b>Note 2</b> When the square root function is used, set the scaling values after square root calculation (e.g., for flow rates or other values) the process value scaling A and B settings.				
	Adjustment period control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and the notice of days remaining set in the Expansion Setting Area have elapsed, this function turns ON a warning flag to give notice that it is time for readjustment.				
	Peak and bot- tom detection	Detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the peak and bottom values in the Expansion Control/Monitor Area.				
	Top and valley detection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the top and valley values in the Expansion Control/Monitor Area.				
	Integral value calculation	This function calculates the analog input value's time integral. The integral value is cal- culated and output to the Expansion Control/Monitor Area when the Integral Value Calculation Start Bit in the Expansion Control/Monitor Area is turned ON.				
Isolation		Between inputs and between inputs and PLC signals: Isolation by transformer and photocoupler.				
Insulation resis	stance	20 M $\Omega$ (at 500 V DC) between all inputs				
Dielectric strer	ngth	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.				
External conne	ections	Terminal block (detachable)				
	ettings	Set by rotary switches on front panel, from 0 to 95.				

Item	Specifications
Indicators	Three LED indicators on front panel (for normal operation, errors detected at the Direct Current Input Unit, and errors detected at the CPU Unit).
Front panel connector	Sensor input connector terminal block (detachable)
Alarm time for CPU Unit cycle time	0.3 ms
Current consumption	5 V DC at 120 mA max., 26 V DC at 120 mA max.
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.
Standard accessories	Short bars (for current input)

#### Accuracy and Resolution in ±10-V User-set Range

The ±10-V user-set range allows the input signal's input range to be set to any range within -10.000 V to 10.000 V. Accuracy and resolution, however, are not determined by the input range, but rather by the measurable input range (-10.000 V to 10.000 V). Therefore, accuracy and resolution do not change even if a narrow input range is set.

### **DM Area Allocations**

First word: word m. m = D20000 + unit number  $\times$  100 (unit number: 0 to 95)

	DM Area address			Data range		Default	Data contents
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
Expansion Setting Area Allocation S				ettings	•		
m+98				0 to 5	0000 to 0005 hex		Area of Expansion Setting Area 0: Not used; 1: DM; 2: CIO; 3: W; 4: H; 5: EM
m+99				0 to 32767	0000 to 7FFF hex		First Word in Expansion Setting Area

Note 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continually refreshed area) or 2 (initial settings area), or in the Expansion Setting Area. The offset from word m to the first address containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

If the first memory address where the out-of-range error occurred is in the Expansion Setting Area, the Address of Data Range Area will be +100 or later. If the first word of the Expansion Setting Area has the error, the Address of Data Range Area will be +100.

- 2. When specifying an expansion setting area be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
- 3. When specifying the first word in an expansion setting area be sure that the end of the memory area is not exceeded.

### **Expansion Setting Area Allocations**

First word: word o. o = address specified in word m+99 in the area specified by word m+98 in the DM Area.

	N.C.	B10	A10 A11	N.C. N.C.	

#### Note

- In both of the above cases, leave all unused inputs open between the positive and negative terminals (e.g., between B1 and B2 for voltage input No. 1).
  - Always ground the GR terminal on the Power Supply Unit of the PLC.
  - If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.
  - Always short-circuit the V and I terminals when using current input.
  - Be sure to tighten the short bars to a torque of 0.5 N•m. Loose short bars may result in conversion errors.

### **Terminal Block Diagram**

### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wiring.
	Check whether an input error has been detected in the I/O Area.

### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The square root function is operat- ing.	Set the square function so that it does not oper- ate.

#### Converted Values are Unstable.

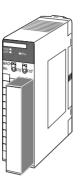

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the I+ and COM input terminals.
	Increase the number of values for calculating the moving average in mean value processing.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

### 2-13 CS1W-PDC55 Isolated-type Direct Current Input Unit

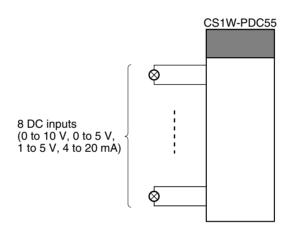

### **Overview**

The CS1W-PDC55 Isolated-type Direct Current Input Unit provides 8 directcurrent inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CS1W-PDC55

### System Configuration

**Features** 

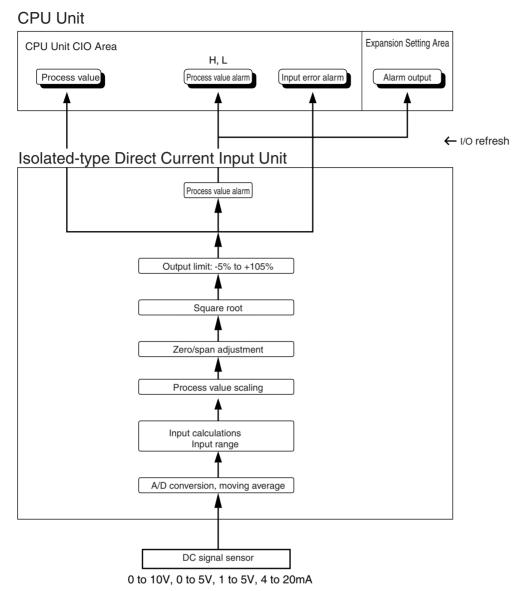

- Up to 8 DC inputs can be made to each Unit.
   0 to 10 V, 0 to 5 V, 1 to 5 V, 4 to 20 mA can be selected separately for each input.
- Scaling values are transmitted to the CPU Unit in four digits hexadecimal.
- There is isolation between channels, so unwanted signal paths between input signals can be prevented.
- Square root function.
- Process value alarms (Two internal alarms per input can be output to memory and two alarms per input can be output to specified I/O memory area addresses using indirect address specifications).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

### **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PDC55	8	0 to 10 V, 0 to 5 V, 1 to 5 V, and 4 to 20 mA (separate for each input)

### CS1W-PDC55 Isolated-type Direct Current Input Unit

### **Block Diagram**

### **Specifications**

Item	Specifications
Model	CS1W-PDC55
Applicable PLC	CS Series
Unit classification	CS-series Special I/O Unit
Mounting position	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)
Maximum number of Units	80 (within the allowable current consumption and power consumption range)
Unit numbers	00 to 95 (Cannot duplicate Special I/O Unit numbers.)

Item		Specifications						
Areas for data Special I/O Unit		10 words/Unit						
exchange with CPU Unit	Area	Isolated-type Direct Current Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flags, input errors						
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Isolated-type Direct Current Input Unit: Input signal type (separate for each input), process value alarm setting (L, H), zero/ span adjustment value, Square root function.						
	Expansion Con- trol/Monitor Area	1 word/Unit CPU Unit to Isolated-type Direct Current Input Unit: Process value alarms						
Number of input	l İs	8						
Input signal type		0 to 10 V, 0 to 5 V, 1 to 5 V, 4 to 20 mA (separate for each input). ("Not used" can be selected).	Input signal type and scaling to industrial units are separate for each of the 8 inputs. <b>Note</b> Input signal type and scaling to					
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (Any mini- mum and maximum values can be set.) (8 inputs set separately.) Data can be con- verted at 0% to 100%.	industrial units are set in the DM Area. Example: Input signal type: 4 to 20 mA; industrial unit scaling: 0 to 500 m <sup>3</sup> /h (after square					
Data storage in the CIO Area		The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Scaling $\rightarrow$ 2) Zero/span adjustment $\rightarrow$ 3) Square root calculation $\rightarrow$ 4) Output limits	root extraction). DM Area settings are as follows: Input signal type: 5 (0005 hex) Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)					
Accuracy (25°C	)	±0.3% of full scale						
Temperature Ch	aracteristics	For voltage inputs: 100 ppm/°C of full scale. For current inputs: 120 ppm/°C of full scale.						
Resolution		1/16,000 of full scale						
Input signal ran	ge	For all inputs: -5 to +105%						
Input impedance	9	For current inputs: 250 $\Omega$ (typical) For voltage inputs: 1 M $\Omega$ min.						
Warmup time		10 min						
Conversion peri	od	250 ms/8 inputs						
Maximum time t CPU Unit	o store data in	Conversion period + one CPU Unit cycle						
Input error dete	ction	Detects sensor error at each input and turns ON the Sensor error Flag. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: 105% of input range; low: -5% of input range)						
Function	Process value alarm	Process value 8-point alarm (L H), hysteresis, and ON-delay timer (0 to 60 s) are available.						
		Two alarms per input (H, L) can be output to addresses in the CIO Area specified in the Expansion Setting Area.						
	Square root cal- culation	When the maximum value for process value scaling is A and the minimum value is B,						
Guidton		$\sqrt{(A - B) \times (input - B)} + B$						
		Drop-out: Output approx. 7% max. linear (	output = input) characteristic					
		the maximum is smaller than the n	g value. The square root will not be found if ninimum.					
		<ul> <li>Note 2 When the square root function is used, set the scaling values after square root calculation (e.g., for flow rates or other values) the process value scaling A and B settings.</li> </ul>						

Item	Specifications
Isolation	Between inputs and between inputs and PLC signals: Isolation by transformer and photocoupler.
Insulation resistance	20 MΩ max. (at 500 V DC).
	Between all input terminals and external AC terminals (Power Supply Unit)
	Between all input terminals and FG plate
Dielectric strength	Between all input terminals and external AC terminals (Power Supply Unit)
	Between all input terminals and FG plate 1,000 VAC, 50/60 Hz 1 min., detection current 1: mA
	Between all channels 500 VAC, 50/60 Hz 1 min., detection current: 1mA
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Three LED indicators on front panel (for normal operation, errors detected at the Direct Current Input Unit, and errors detected at the CPU Unit).
Front panel connector	Sensor input connector terminal block (detachable)
Alarm time for CPU Unit cycle time	0.4 ms
Current consumption	5 V DC at 180 mA max., 26 V DC at 60 mA max.
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.

(See note 3) hex)

Note

 The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area). The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

2. The operation settings are shown in the following table

### Section 2-13

3. A range check is not performed for the Expansion Setting Area address set in word m+84. Be sure to check this address before starting actual operation.

Word	Bits	Description	Settings
m+34	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 contains 1000.

### **Expansion Setting Area**

First word: word o. (o =	address specified in word m+60 in the DM Area)
--------------------------	--

Direction	Word	Bit	1	lame	Data range	Contents
Direct Current Input Unit to CPU Unit	0	00	Input No. 1	Process value L (low limit) alarm	0, 1	0: Process value > Set value 1: Process value $\leq$ Set value
CPO Unit		01		Process value H (high limit) alarm	0, 1	0: Process value < Set value 1: Process value ≥ Set value
		02	Input No. 2	Process value L (low limit) alarm	0, 1	Same as for input No. 1.
		03		Process value H (high limit) alarm	0, 1	
		04	Input No. 3	Process value L (low limit) alarm	0, 1	
		05		Process value H (high limit) alarm	0, 1	
		06	Input No. 4	Process value L (low limit) alarm	0, 1	
		07		Process value H (high limit) alarm	0, 1	
		08	Input No. 5	Process value L (low limit) alarm	0, 1	
		09		Process value H (high limit) alarm	0, 1	
		10	Input No. 6	Process value L (low limit) alarm	0, 1	
		11		Process value H (high limit) alarm	0, 1	
		12	Input No. 7	Process value L (low limit) alarm	0, 1	
		13		Process value H (high limit) alarm	0, 1	
		14	Input No. 8	Process value L (low limit) alarm	0, 1	
		15		Process value H (high limit) alarm	0, 1	

**Note** If either of the following changes is made for the Expansion Setting Area for the CS1W-PTS55/PTS56/PDC55, the previous data will be left in the Expansion Setting Area even after the change has been made. Clear the previous data when changing either of these settings.

> • The Expansion Setting Area Enable setting is changed from "enabled" to "disabled."

> • The Expansion Setting Area Address setting is changed while the Expansion Setting Area Enable setting is set to "enabled."

### **<u>CIO Area Allocations</u>**

First word: $n = 2000 + unit number \times 10^{10}$	0 (unit number: 0 to 95)
---	--------------------------

Direction	Word	Bit	1	Name	Data range	Contents

### CS1W-PDC55 Isolated-type Direct Current Input Unit

Note

- In both of the above cases, leave all unused inputs open between the positive and negative terminals.
  - Always short-circuit the V and I terminals when using current input.

- Be sure to tighten the short bars to a torque of 0.5 N•m. Loose short bars may result in conversion errors.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

### **Terminal Block Diagram**

### **Error Processing**

### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir-ing.
	Check whether an input error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The square root function is operat- ing.	Set the square function so that it does not oper- ate.

### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the I+ and COM input terminals.
	Increase the number of values for calculating the moving average in mean value processing.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

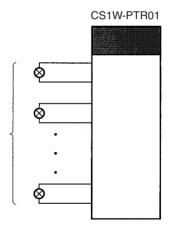

## 2-14 CS1W-PTR01 Power Transducer Input Unit

### **Overview**

The CS1W-PTR01 Power Transducer Input Unit provides up to eight inputs of 0 to 1 mA or -1 to 1 mA from power transducers, and sends the data to the CPU Unit each cycle.

### System Configuration

Eight power transducer inputs (0 to 1 mA or -1 to 1 mA)

### Features

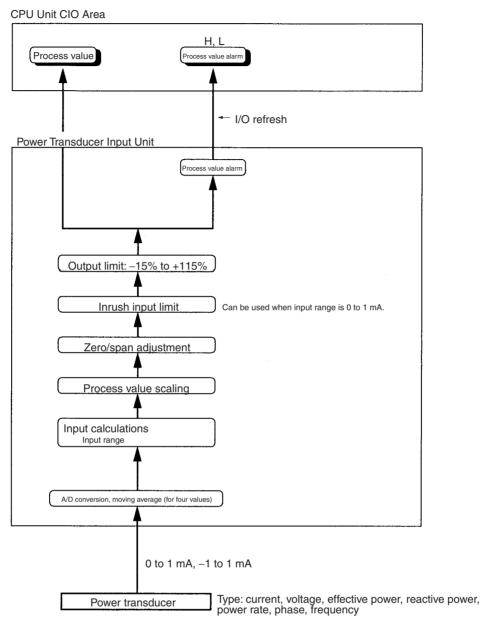

- Up to eight inputs of 0 to 1 mA or -1 to 1 mA from a power transducer can be separately connected.
- Scaling values are sent to the CPU Unit in four digits hexadecimal.
- The inrush input limit function temporarily limits the process value input to a given set value when it increases from a low value (2%), in order to prevent process values from being jumped up by an inrush current when the motor is started up, and so on. (This function is available for inputs of 0 to 1 mA only.)
- Two values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing (for four values).
- Zero/span adjustment capability during operation.

### **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PTR01		Either of the following can be selected separately: 0 to 1 mA, or –1 to 1 mA.

### Block Diagram (Order of Processing)

The processing for the eight inputs is as shown in the following diagram.

### **Specifications**

Item	Specifications
Model	CS1W-PTR01
Applicable PLC	CS Series
Unit classification	CS-series Special I/O Unit
Mounting position	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)
Maximum number of Units	80 (within the allowable current consumption and power consumption range)
Unit numbers	00 to 95 (Cannot duplicate Special I/O Unit numbers.)

Item		Specifications					
Areas for data	Special I/O Unit	10 words/Unit					
exchange with CPU Unit	Area	Power Transducer Input Unit to CPU Unit: All process values, process value alarms (L, H)					
	DM Area words	100 words/Unit					
	allocated to Special I/O Units	CPU Unit to Power Transducer Input Unit: Input signal type, scaling of process value in industrial units, process value alarm set- ting (L, H), inrush input upper limit, inrush input upper limit time, zero/span adjustment value, etc.					
Number of inputs	6	8					
Input signal type		Either 0 to 1 mA or –1 to 1 mA.	Input signal type and scaling to industrial				
User-defined sca units	aling in industrial	Scaling required for the above input sig- nals. (Any minimum and maximum values can be set.) (8 inputs set separately.)	units are separate for each of the 8 inputs. <b>Note</b> Input signal type and scaling to industrial units are set in the DM				
Data storage in t	he CIO Area	The value derived from carrying out the following processing in order of the process value data is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Inrush input limit $\rightarrow$ 5) Output limits	Area. Example: Input signal type: 0 to 1 mA from power transducer; industrial unit scaling: 0 to 500 W. DM Area settings are as follows: Input signal type: 0 (0000 hex) Industrial unit maximum value stored: 500 (01F4 hex) Industrial unit minimum value stored: 0 (0000 hex)				
Accuracy (25°C)		±0.2% of full scale					
Temperature coe	efficient	±0.015%/°C of full scale					
Resolution		1/4,096 of full scale					
Input signal rang	е	For 0 to 1 mA: –15 to 115%; for –1 to 1 mA: –7.5 to 107.5%					
Input impedance		100 $\Omega$ (typical)					
Warmup time		10 min					
Response time		1.2 s (travel time from input 0% to 90%, for step input)					
Conversion perio	bd	200 ms/8 inputs					
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle					
Input error detec	tion	None.					
Operation at input	ut disconnection	Process value corresponding to 0 mA store	ed.				
Function	Inrush input limit	When the process value is increased from 2% or less, the inrush input limit function limits the increase for a set time. (It is available only for inputs of 0 to 1 mA.) This function can be used to prevent sudden process value increases due to inrush currents caused by motor startup and so on. Upper limit value: -32,000 to 32,000					
	Process value alarm	Upper limit time: 0 to 100 s Process value 2-point alarm (H, L), hysteresis, and ON-delay timer (0 to 60 s) are available.					
Mean value processing (input filter)		Calculates the moving average for the past four process values (every 200 ms), and stores that value in the CIO Area as the process value.					
Isolation		Between inputs: No isolation Between input terminals and PLC signals: Isolation by transformer and photocoupler					
Insulation resista	ance	20 M $\Omega$ (at 500 V DC) between inputs and internal PLC signals					
Dielectric strengt	th	Between inputs and internal PLC signals: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.					
External connect	tions	Terminal block (detachable)					
Unit number sett	ings	Set by rotary switches on front panel, from 0 to 95.					
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Power Transducer Input Unit, and errors related to the CPU Unit).					

Item	Specifications	
Front panel connector	Sensor input connector terminal block (detachable)	
Alarm time for CPU Unit cycle time	0.3 ms	
Current consumption	5 V DC at 150 mA max., 26 V DC at 80 mA max.	
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$	
	Note The height including the Backplane is 145 mm.	
Weight	450 g max.	
Standard accessories	None

### **Terminal Block Diagram**

CS1W-PRT01 Power Transducer Input Unit

### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wiring.

### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The inrush input limit function is operating.	Set the inrush input limit function so that it does not operate.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the positive and negative input terminals.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

### 2-15 CS1W-PTR02 Analog Input Unit (100 mV)

### **Overview**

The CS1W-PTR02 Analog Input Unit provides up to eight inputs of 0 to 100 mV or -100 to 100 mA, and sends the data to the CPU Unit each cycle.

CS1W-PTR02

### **System Configuration**

- Up to eight inputs of 0 to 100 mV or -100 to 100 mV can be separately connected.
- Scaling values are sent to the CPU Unit in four digits hexadecimal.
- The inrush input limit function temporarily limits the process value input to a given set value when it increases from a low value (2%), in order to prevent process values from being jumped up by an inrush current when the motor is started up, and so on. (This function is available for inputs of 0 to 100 mV only.)
- Two values for each process value alarm input.
- ON-delay timer for process value alarm.

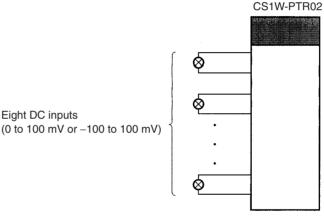

Eight DC inputs

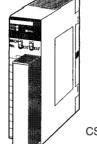

- Mean value processing (for four values).
- Zero/span adjustment capability during operation.

#### **Model Information**

**Features** 

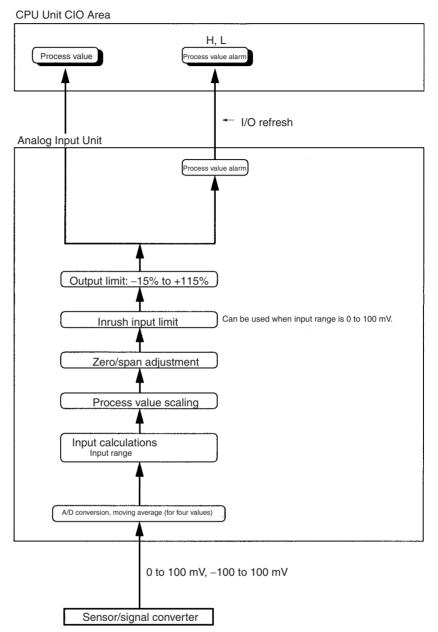

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PTR02		Either of the following can be selected separately: 0 to 100 mV, or $-100$ to 100 mV.

### Block Diagram (Order of Processing)

Function Inrush input limit		When the process value is increased from 2% or less, the inrush input limit function limits the increase for a set time. (It is available only for inputs of 0 to 100 mV.) This function can be used to prevent sudden process value increases due to inrush cur- rents caused by motor startup and so on. Upper limit value: -32,000 to 32,000 Upper limit time: 0 to 100 s					
	Process value alarm	Process value 2-point alarm (H, L), hysteresis, and ON-delay timer (0 to 60 s) are available.					
	Mean value processing (input filter)	Calculates the moving average for the past four process values (every 200 ms), and stores that value in the CIO Area as the process value.					
Isolation		Between inputs: No isolation Between input terminals and PLC signals:	Isolation by transformer and photocoupler.				

Item	Specifications
Insulation resistance	20 M $\Omega$ (at 500 V DC) between inputs and internal PLC signals.
Dielectric strength	Between inputs and internal PLC signals: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current: 10 mA max.
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Three LED indicators on front panel (for normal operation, errors detected at the Analog Input Unit, and errors related to the CPU Unit).
Front panel connector	Sensor input connector terminal block (detachable)
Alarm time for CPU Unit cycle time	0.3 ms
Current consumption	5 V DC at 150 mA max., 26 V DC at 80 mA max.
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$
	Note The height including the Backplane is 145 mm.
Weight	450 g max.
Standard accessories	None

### **Terminal Connection Diagram**

**Note** Short-circuit all unused inputs between the positive and negative terminals (e.g., between A1, and A2 for input No. 1) with the lead wire.

### **Terminal Block Diagram**

### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wiring.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
The inrush input limit function is operating.	Set the inrush input limit function so that it does not operate.

#### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the positive and negative input terminals.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

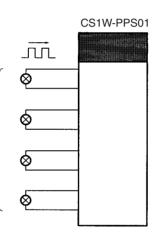

## 2-16 CS1W-PPS01 Isolated-type Pulse Input Unit

## **Overview**

The CS1W-PPS01 Isolated-type Pulse Input Unit provides up to four pulses from a device such as a displacement flowmeter, and sends scaled instantaneous values (pulses/time unit) to the CPU Unit each cycle. The accumulated value can also be calculated at the same time and transferred to the CPU Unit at each cycle.

## **System Configuration**

## **Features**

- Up to four pulse inputs can be connected per Unit.
- $\bullet$  Instantaneous values (pulses  $\times$  pulse weight/time unit) are scaled and sent to the CPU Unit in four digits hexadecimal.
- Four values for each instantaneous value alarm input
- ON-delay timer for instantaneous value alarm

Four pulse inputs from a device such as a displacement flowmeter

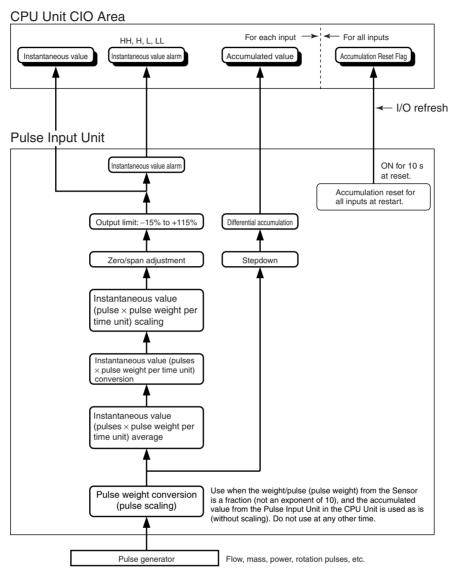

- Mean value processing
- · Zero/span adjustment capability during operation
- Accumulated value output

#### **Model Information**

Unit classification	Model number	Inputs	Input types
CS-series Special I/O Unit	CS1W-PPS01	4	Pulse inputs of 0 to 20,000 pulses/s or 0 to 20 pulses/s

## Block Diagram (Order of Processing)

The processing for the four inputs is as shown in the following diagram.

## **Specifications**

Ite	em	Specifications			
Model		CS1W-PPS01			
Applicable PLC		CS-series			
Unit classification		CS-series Special I/O Unit			
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)			
Maximum numbe	er of Units	80 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Pulse Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), accumulated values, Accu- mulation Reset Bit			
DM Area words allocated to Special I/O Units		100 words/Unit CPU Unit to Pulse Input Unit: Instantaneous value conversion coefficient, instantaneous value scaling, pulse weight, number of values for moving average, instantaneous value alarm settings (LL, L, H, HH), zero/span adjustment, etc.			
Number of pulse	inputs	4			
Pulse input type		Voltage input, no-voltage semiconductor input, contact input (selected individually for each of 4 inputs, according to connection terminals)			
		No-voltage semiconductor input: Connected to voltage input terminals (between Fn+ and COMn).			
		Maximum coefficient speed: 20,000 pulses/s (duty ratio: 50%) Detection voltage: 4 V DC Short-circuit current between terminals: 1.2 mA DC ON resistance: 0.8 k $\Omega$ max. OFF resistance: 5.0 k $\Omega$ min.			
		Voltage input: Connected to voltage input terminals (between Fn+ and COMn). Waveform: Square wave Maximum coefficient speed: 20,000 pulses/s (duty ratio: 50%) ON voltage: 0 to 1 V OFF voltage: 3 to 30 V			
		Contact input: Connected to contact input terminals (between Sn+ and COMn).			
		Maximum coefficient speed: 20 pulses/s (duty ratio: 50%) Detection voltage: 8 V DC Short-circuit current between terminals: 2.4 mA DC ON resistance: 0.8 k $\Omega$ max. OFF resistance: 5.0 k $\Omega$ min.			
Sensor power supply		For no-voltage semiconductor inputs, etc., a 12-V DC power supply can be provided for the sensors that are the pulse sources.			
		Output voltage: 12 V DC ±15% Current capacity: 30 mA max. Limit current when short-circuited: 31 to 55 mA Allowable short-circuit time: No limit			
Accumulation co	nversion period	100 ms/4 inputs			
Maximum time to CPU Unit		Conversion period + one CPU Unit cycle			

	Item		Specifications			
Function	Function Instantaneous value output		This function can be used to count the number of pulses per time unit, and to convert the values to instantaneous values (pulses x pulse weight / time unit). Any of the following can be selected as the time unit: 1 s, 3 s, 10 s, 30 s, or 60 s. (The time unit is set in the DM Area.)			
			Note 1 Errors and fluctuations wil pulse rate is low, so specif			
				s only refreshed at intervals of the hen the Unit is restarted, the e 0000 until the time set as the		
				obtained by multiplying the actual the pulse weight (0.1000 to		
		Instantaneous value scaling	This function can be used for scaling instantaneous values (pulses x pulse weight/time unit), i.e., setting data with respect to a maximum value, and storing them in the allocated words of the CIO Area.	Example1: To obtain a pulse input of 0 to 2,000 pulses/s for a flow of 0 to 300.0 ml/s: Time unit: 1 s Instantaneous value 100% input: 2,000		
			<ul> <li>When instantaneous value (pulses x pulse weight/time unit) is 100% input: Can be set from 0.001 pulses/ time unit to 32,000 pulses/ time unit.</li> </ul>	Maximum value for instanta- neous value scaling (industrial units): 3,000 Example 2: When pulse inputs at 0 to 2,000		
			<ul> <li>Maximum value for Instanta- neous value scaling (industrial units): Scaling of the above instanta- neous value (100% input) is possible from         <ul> <li>-32,000 to 32,000 (8300 to FFFF, 0000 to 7D00 Hex).</li> </ul> </li> </ul>	pulses/s are obtained for a flow- rate of 0 to 300.0 ml/s, and the pulse weight function is used for totaling: There are 0.15 ml per pulse, so the pulse weight = 0.15. For a flowrate of 0 to 300.0 ml/s,		
			Note When pulse weight con- version is used for accu- mulated values, scaling is already performed for each pulse, so an expo- nent of 10 of the industrial unit is set in the instanta- neous value (pulses x pulse weight per time unit) for a 100% input.	0 to 2,000 x 0.15 = 300 pulses/s. Therefore, Time unit: 1 s Instantaneous value 100% input: 300 Maximum value for instanta- neous value scaling (industrial units): 3,000		
		Data storage in the CIO Area	The value derived from carrying out the following processing in order of the instantaneous value (pulses x pulse weight/time unit) is stored in four digits hexadeci- mal (binary values) in the allo- cated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Instantaneous value scaling $\rightarrow$ 3) Scaling $\rightarrow$ 4) Zero/span adjustment $\rightarrow$ 5) Output limits			
		Mean value pro- cessing (input fil- ter)	Calculates the moving average for instantaneous values (1 to 16), and Area as the instantaneous value.			
		Instantaneous value alarm	Instantaneous value 4-point alarn ON-delay timer (0 to 60 s) are ava			

lt	Item		Specifications				
Function	Accumulated	Pulse weight	Performs scaling for a single pulse.				
	output	conversion	Use for the accumulated value when the pulse weight (weight/ pulse) is a fraction (not an exponent of 10). (See note.)				
			The pulse weight (0.1 to 3.2) is multiplied by the actual number of pulses input. This number of pulses is used as the input for conversion to instantaneous values (pulses x pulse weight per time unit) and the input for totaling prior to stepdown.				
			Example: When the pulse weight from the flowmeter is 0.26 ml/ pulse, the pulse weight is set to 0.26. When one pulse (0.26 ml) is input, it is treated as a 0.26 pulse, and when two pulses (0.52 ml) are input, they are treated as a 0.52 pulse.				
			The weight per pulse becomes 1 ml, so to calculate in the CPU Unit the simple (unscaled) value in industrial units (ml) based on the accumulated value from the Pulse Input Unit (value in words n+5 to n+8), the value can be calculated simply using 1 ml/pulse.				
			Note When the accumulated value from the Pulse Input Unit in the CPU Unit is not used (i.e., when only the instantaneous value is used), pulse weight conversion is not required. Use instantaneousness value scaling to convert to industrial units.				
		Accumulated value	The accumulated number of pulses (0 to 9,999 pulses) for each input is stored in the allocated words of the CIO Area. When 9,999 is exceeded, the value returns to 0 and starts counting again.				
			<b>Note</b> When pulse weight conversion is used, the accumulated value for the number of pulses obtained by multiplying the actual number of input pulses by the pulse weight (0.1000 to 3.2000) is used.				
		Stepdown	When the accumulated value is used, this function prevents accumulated value overflow by reducing the number of input pulses. The actual number of input pulses is multiplied by one of four factors ( $x1$ , $x0.1$ , $x0.01$ , or $x0.001$ ), and the number of input pulses accumulated is then based on that value.				
			<b>Note</b> This stepdown function operates only for accumulated values, and not for instantaneous values. When the pulse weight conversion function is used, it uses for the number of pulses obtained by multiplying the actual number of input pulses by the pulse weight (0.1000 to 3.2000).

## 3-wire Sensor Input

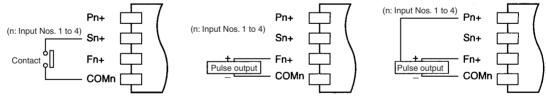

CS1W-PPS01 Isolated-type Pulse Input Unit

**Note** In all of the above cases, leave all unused inputs open between the terminals (e.g., between B1 and B2 for no-voltage semiconductor input No. 1).

#### **Terminal Block Diagram**

### **Error Processing**

#### Accumulated Values Do Not Change.

Probable cause	Remedy
input wiring is faulty, or wiring is	Check whether the input voltage has changed to exceed the minimum OFF voltage or the maximum ON voltage.
disconnected.	Check for faulty or disconnected wiring.

#### Accumulation Data is Different from the Number of Pulses Input.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the positive and negative input terminals.
The pulse weight or accumulation stepdown settings are incorrect.	Check the pulse weight and accumulation stepdown settings.
Pulses exceeding the allowable frequency are being input.	Check the input signal waveform and correct them for the entire system.
Pulses with defects such as chat- tering are being input.	Check the input signal waveform and remove chattering from external circuitry.

### Instantaneous Values Do Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The instantaneous value when input 100%, or the maximum instantaneous value in the range, is set to 0.	Set the instantaneous value when input 100%, and the maximum instantaneous value in the range, to a value other than 0.

#### Instantaneous Values are Not Converted as Intended.

Probable cause	Remedy
The instantaneous value when input 100%, or the maximum instantaneous value scaling value, is incorrect.	Check the instantaneous value when input 100%, the decimal point position, and the maximum instantaneous value scaling value.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment settings.
Input pulses are too slow (i.e., the pulse rate is to low).	Lengthen the instantaneous value time unit (conversion period).
There is pulsating in the instanta- neous value.	Set the number of values for moving average processing.
When using pulse weight conver- sion for accumulated values, the value obtained from pulses x pulse weight per time unit is not set for the instantaneous value for 100% input.	Set the instantaneous value for 100% input as pulses x pulse weight/time unit.

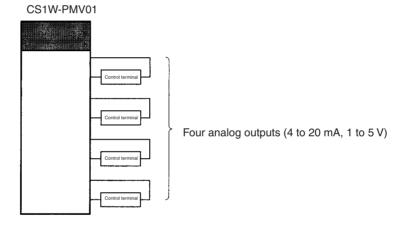

## 2-17 CS1W-PMV01 Isolated-type Analog Output Unit

### **Overview**

Each cycle, the CS1W-PMV01 Isolated-type Analog Output Unit converts up to four analog output set values from the CPU Unit to either 4 to 20 mA or 1 to 5 V, and outputs them. It can also provide answer back for checking actual output values.

## System Configuration

## **Features**

- Outputs in either 4 to 20 mA or 1 to 5 V (set separately for each of the four outputs) the analog output values set in the allocated words of the CPU Unit's CIO Area.
- Answer input function. Actual output signals of 4 to 20 mA or 1 to 5 V are checked by being read again from the output circuit, and are stored in the allocated words in the CIO Area. Mean value processing is also possible.
- Output disconnection detection function (current output only).
- Output high/low limit function.
- Rate-of-change limit function.
- Output hold function when CPU Unit errors occur. When a CPU Unit fatal error (including FALS execution), or a CPU error in the CPU Unit occurs, or all outputs are turned OFF with the Output OFF Bit, this function can hold either a preset value or the analog output value prior to the error.
- Zero/span adjustment capability during operation.

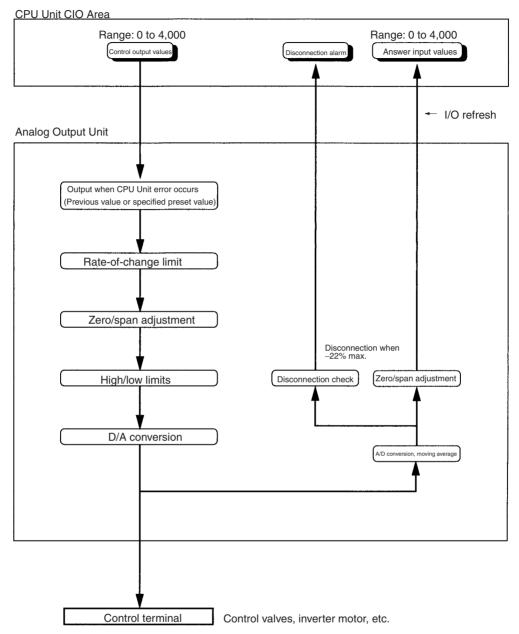

### **Model Information**

Unit classification	Model number	Outputs	Outputs
CS-series Special I/O Unit	CS1W-PMV01	4	4 to 20 mA, 1 to 5 V (separate for each of four outputs)

#### CS1W-PMV01 Isolated-type Analog Output Unit

### Block Diagram (Order of Processing)

The processing for the four outputs is as shown in the following diagram.

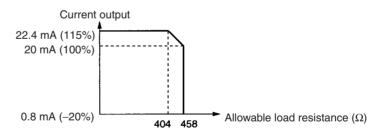

## **Specifications**

Item		Specifications			
Model		CS1W-PMV01			
Applicable PLC		CS Series			
Unit classification		CS-series Special I/O Unit			
Mounting position		CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)			
Maximum numbe	er of Units	80 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data	Special I/O Unit	10 words/Unit			
exchange with CPU Unit	Area	CPU Unit to Analog Output Unit: Analog output values for each output			
		Analog Output Unit to CPU Unit: Answer input values for each output, output disconnection			
	DM Area words	100 words/Unit			
	allocated to Special I/O Units	CPU Unit to Analog Output Unit: Output hold for when CPU Unit error occurs, high/low limit values, rate-of-change limit values (positive and negative directions), number of values for answer input moving average, zero/span adjustment for control outputs and answer inputs, etc.			
Number of output	its	4			
Output signal typ	Des	Either 4 to 20 mA or 1 to 5 V (separate for each of the four outputs). Switched according to the connection terminals.			
User-defined sca units	aling in industrial	None			
Data storage in t	he CIO Area	0 to 4,000 (0000 to 0FA0 hex), fixed 0: 4 mA or 1 V; 4,000: 20 mA or 5 V			
		The values derived from carrying out the following processing in order of the values in the allocated words in the CIO Area are output in analog. 1) Output hold $\rightarrow$ 2) Rate-of-change limit $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) High/low limits			
		Therefore, the values after processing are confirmed by analog inputs.			
Accuracy (25°C)		When 4 to 20 mA: ±0.1% of full scale When 1 to 5 V: ±0.2% of full scale			
Temperature coefficient		±0.015%/°C of full scale			
Resolution		1/4,000 of full scale			
Warmup time		10 min			
Output response		0.2 s (travel time from output 0% to 100%, for step output)			
D/A conversion p	period	100 ms/4 outputs			
Maximum time to CPU Unit		Conversion period + one CPU Unit cycle			
Output signal rar	-	Approx. –20 to 115%			
Allowable load resistance		When 4 to 20 mA: 404 $\Omega$ max. (when output range is –20 to 115%) or 458 $\Omega$ max. (when output range is –20 to 100%) (Refer to note.) When 1 to 5 V: 250 k $\Omega$ max.			
Output impedance		When 1 to 5 V: 250 Ω (typical)			
Voltage when open between ter- minals		Approx. 15 V			
Answer input function		The actual analog output values (4 to 20 mA or 1 to 5 V) from the Unit's output termi- nals can be read.			
		Data stored to allocated words of CIO Area: 0 to 4,000 (0000 to 0FA0 hex), fixed. (When 4 mA or 1 V: 0; when 20 mA or 5 V: 4,000)			
		Accuracy: ±0.2% of full scale Resolution: 1/2000 Temperature coefficient: ±0.015%/°C			

	Item	Specifications		
Current output disconnection detection function		When the actual output of 4 to 20 mA from the Analog Output Unit's output terminals is 0.5 mA or less, it is regarded as an external output circuit current loop disconnection, and the Output Disconnection Flag turns ON.		
Function	Rate-of-change limit	This function can be used to control the speed of up and down changes in analog out- put values.		
	Output high/low limits	This function can be used to place high and low limits on analog output values.		
	Output hold	This function holds the analog output value to the previous value or to a specified pre- set value when any of the following CPU Unit errors occurs, and outputs the analog output value in the CIO Area when the error is cleared.		
		<ul> <li>CPU Unit fatal error (including FALS execution)</li> <li>CPU error in CPU Unit</li> <li>All outputs turned OFF with Output OFF Bit</li> </ul>		
Isolation		Between outputs and between output terminals and PLC signals: Isolation by trans- former and photocoupler		
Insulation resistance		20 M $\Omega$ (at 500 V DC) between outputs		
Dielectric stre	ngth	Between outputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.		
External conn	ections	Terminal block (detachable)		
Unit number s	settings	Set by rotary switches on front panel, from 0 to 95.		
Indicators		Three LED indicators on front panel (for normal operation, errors detected at the Analog Output Unit, and errors related to the CPU Unit).		
Front panel co	onnector	Output connector terminal block (detachable)		
Alarm time for CPU Unit cycle time		e 0.3 ms		
Current consumption		5 V DC at 150 mA max., 26 V DC at 160 mA max.		
Dimensions		$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$		
		Note The height including the Backplane is 145 mm.		
Weight		450 g max.		
Standard acco	essories	None		

**Note** The following diagram shows the relationship between the allowable load resistance and the current output.

### **Output Values According to CPU Unit Status**

Analog output values from the Analog Output Unit will be as shown in the following table, depending on the status of the CPU Unit.

CPU Unit status	Analog output	values from Unit	
Fatal error (including FALS(007) execution)	The output hold function holds the previous value or a specified preset value.		
CPU error			
All outputs turned OFF with Output OFF Bit			
Change of operation mode from RUN or Monitor to Program (See note.)	When the CPU Unit's I/O Memory Hold Flag (A500.12) is OFF.	The output value in the CIO Area is cleared, and that value (0000 hex) is output refreshed.	
	When the CPU Unit's I/O Memory Hold Flag (A500.12) is ON.	The output value in the CIO Area is held at the value prior to the operation mode change, and that is output refreshed.	
Fatal error or CPU standby after turning ON the power supply	Either 0 mA or 0 V is output.		
Special I/O Unit cyclic refresh disabled	Outputs can be refreshed by ladder diagram program.	means of IORF(097) in the	

**Note** Regardless of the CPU Unit's operation mode (including Program Mode), the analog output value in the allocated words of the CIO Area is always output refreshed. As shown in the above table, however, when the operation mode is changed to Program Mode, the analog output value in the CIO Area is either cleared or held depending on the status of the CPU Unit's I/O Memory Hold Flag (A500.12). In particular, be careful when this flag is ON, because the value prior to the mode change will be held and that value will be output refreshed.

### **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

Output No. 1	Output No. 2	Output No. 3	Output No. 4	Decimal	Hexadecimal	Default	Data contents
m				12345, 0	3039, 0000 hex	0000 hex	Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM words m+2 to m+45.
							<ul> <li>12345 (3039 hex): The data in words m+2 to m+45 is transferred from the Analog Output Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.</li> </ul>
							<ul> <li>Other than 12345 (3039 hex) (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Analog Output Unit.</li> </ul>

## Terminal Block Diagram

## Error Processing

#### Outputs Do Not Change.

Probable cause	Remedy
The span adjustment value in the output zero/span adjustment is set to 0.	Set the span adjustment to the Unit's default value.
The high/low limit is operating.	Set the high/low limit to the Unit's default value.
The output data is set out of range.	Correct the data so that it falls within the range.
All outputs have been turned OFF with the Output OFF Bit.	Turn OFF the Output OFF Bit.

#### Outputs are Not Converted as Intended.

Probable cause	Remedy
The span adjustment value in the output zero/span adjustment is set to 0.	Set the span adjustment to the Unit's default value.
An output device's I/O specifica- tions do not conform.	Check the load impedance. Change the remote device.
The rate-of-change limit is too low, and the change is too slow.	Correct the rate-of-change limit setting.

#### Outputs are Unstable.

Probable cause	Remedy
Output signals are being affected by external noise.	Change the connection paths of the output signal lines. (Separate them from sources of noise or use shielded cable.)

#### Answer Input Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
An output device is malfunction- ing, output wiring is faulty, or wir- ing is disconnected.	Check whether the output voltage or current has changed. Check for faulty or discon- nected wiring. Check whether a disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The zero/span adjustment, high/ low limit, or rate-of-change value is incorrect.	Check and correct the settings.
An output device's I/O specifica- tions do not conform.	Check the load impedance. Change the remote device.

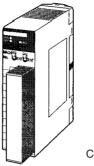

#### Converted Values are Unstable.

Probable cause	Remedy
Output signals are being affected by external noise.	Change the connection paths of the output signal lines. (Separate them from sources of noise or use shielded cable.)
	Increase the number of values for calculating the moving average in mean value processing.

## 2-18 CS1W-PMV02 Isolated-type Analog Output Unit

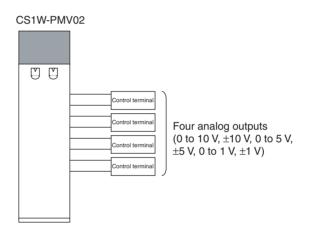

### **Overview**

Each cycle, the CS1W-PMV02 Isolated-type Analog Output Unit converts up to four analog output set values from the CPU Unit to analog voltage signals and outputs them.

#### CS1W-PMV02

### **System Configuration**

### **Features**

- Outputs the analog output values set in the allocated words of the CPU Unit's CIO Area. (Supported output ranges: -10 to 10 V, 0 to 10 V, -5 to 5 V, 0 to 5 V, -1 to 1 V, 0 to 1 V.)
- Output high/low limit function.
- Rate-of-change limit function.
- Output hold function when CPU Unit errors occur. When a CPU Unit fatal error (including FALS execution), or a CPU error in the CPU Unit occurs, or all outputs are turned OFF with the Output OFF Bit, this function can hold either a preset value or the analog output value prior to the error.
- Zero/span adjustment capability during operation.

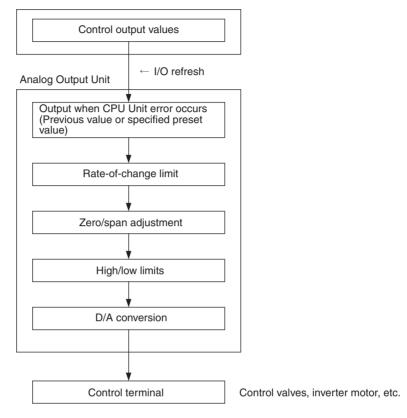

#### **Model Information**

Unit classification	Model number	Outputs	Outputs
CS-series Special I/O Unit	CS1W-PMV02	4	-10 to 10 V, 0 to 10 V, $-5$ to 5 V, 0 to 5 V, $-1$ to 1 V, 0 to 1 V

## Block Diagram (Order of Processing)

The processing for the four outputs is as shown in the following diagram.

CPU Unit CIO Area

## **Specifications**

Item		Specifications			
Model		CS1W-PMV02			
Applicable PLC		CS Series			
Unit classification		CS-series Special I/O Unit			
Mounting position	n	CS-series CPU Rack or CS-series Expansion Rack (Cannot be mounted to C200H Expansion I/O Rack or SYSMAC BUS Remote I/O Slave Rack.)			
Maximum numbe	er of Units	80 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data	Special I/O Unit	10 words/Unit			
exchange with CPU Unit	Area	CPU Unit to Analog Output Unit: Analog output values for each output			
		Analog Output Unit to CPU Unit: None			
	DM Area words	100 words/Unit			
	allocated to Special I/O Units	CPU Unit to Analog Output Unit: Output hold for when CPU Unit error occurs, high/low limit values, rate-of-change limit values, zero/span adjustment for control outputs, etc.			
Number of output	ts	4			
Output signal typ	bes	0 to 10 V, 0 to 5 V, 0 to 1 V, –10 to 10 V, –5 to 5 V, –1 to 1 V (Each output point can be set individually.)			
User-defined sca units	aling in industrial	Scaling is possible for each of the above signal types individually. (The data corresponding to the minimum and maximum output values can be set freely.)			
Data storage in t	he CIO Area	$\pm$ 32,000 (8300 to FFFF hex, 0000 to 7D00 hex)			
Accuracy (25°C)		±0.1% of full scale

Answer input fun	ction	None			
Current output disconnection detection function		None			
Function	Rate-of-change limit	This function can be used to control the speed of up and down changes in analog out put values.			
	Output high/low limits	This function can be used to place high and low limits on analog output values.			
	Output hold	This function holds the analog output value to the previous value or to a specified pre- set value when any of the following CPU Unit errors occurs. Normal operation is restored when the CPU Unit error is cleared.			
		<ul> <li>CPU Unit fatal error (including FALS execution)</li> <li>CPU error in CPU Unit</li> <li>CPU Unit's load interrupted</li> </ul>			
Isolation		Between outputs and between output terminals and PLC signals: Isolation by trans- former and photocoupler			

Item	Specifications	
Insulation resistance	20 M $\Omega$ (at 500 V DC) between outputs	
Dielectric strength	Between outputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.	
External connections	Terminal block (detachable)	
Unit number settings	Set by rotary switches on front panel, from 0 to 95.	
Indicators	Three LED indicators on front panel (for normal operation, errors detected at the Analog Output Unit, and errors related to the CPU Unit).	
Front panel connector	Output connector terminal block (detachable)	
Alarm time for CPU Unit cycle time	0.3 ms	
Current consumption	5 V DC at 120 mA max., 26 V DC at 120 mA max.	
Dimensions	$35 \times 130 \times 126 \text{ mm} (W \times H \times D)$	
	Note The height including the Backplane is 145 mm.	
Weight	450 g max.	
Standard accessories	None	

#### Output Values According to CPU Unit Status

Analog output values from the Analog Output Unit will be as shown in the following table, depending on the status of the CPU Unit.

CPU Unit status	Analog output	values from Unit	
Fatal error (including FALS(007) execution)	The output hold function hold specified preset value.	s the previous value or a	
CPU error			
All outputs turned OFF with Output OFF Bit			
Change of operation mode from RUN or Monitor to Program (See note.)	When the CPU Unit's I/O Memory Hold Flag (A500.12) is OFF.	The output value in the CIO Area is cleared, and that value (0000 hex) is output refreshed.	
	When the CPU Unit's I/O Memory Hold Flag (A500.12) is ON.	The output value in the CIO Area is held at the value prior to the operation mode change, and that is output refreshed.	
Fatal error or CPU standby after turning ON the power supply	0 V is output.		
Special I/O Unit cyclic refresh disabled	Outputs can be refreshed by means of IORF(097) in the ladder diagram program.		

**Note** Regardless of the CPU Unit's operation mode (including Program Mode), the analog output value in the allocated words of the CIO Area is always output refreshed. As shown in the above table, however, when the operation mode is changed to Program Mode, the analog output value in the CIO Area is either cleared or held depending on the status of the I/O Memory Hold Flag (A500.12). In particular, be careful when this flag is ON, because the value prior to the mode change will be held and that value will be output refreshed.

## **DM Area Allocations**

 $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

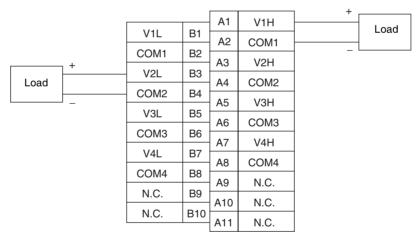

Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal	Default	Data contents
m				12345, 0	3039, 0000 hex	0000 hex	Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM words m+2 to m+61.
							<ul> <li>12345 (3039 hex): The data in words m+2 to m+61 is transferred from the Analog Output Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.</li> </ul>
							• Other than 12345 (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Analog Output Unit.

	n + 9	00 to 15			

#### $n = 2000 + unit number \times 10$ (unit number: 0 to 95)

### **Terminal Connection Diagram**

CS1W-PMV02 Isolated-type Analog Output Unit

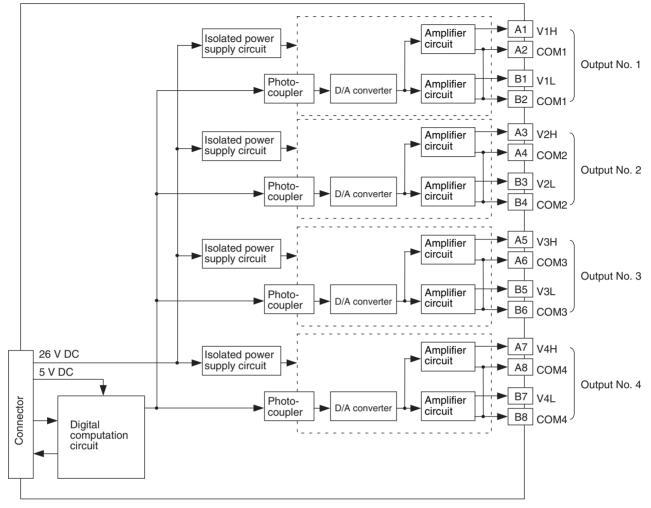

B terminals: 0 to 1 V,  $\pm 1$  V; A terminals: 0 to 10 V, 0 to 5 V,  $\pm 10$  V,  $\pm 5$  V

Note

- 1. Although signals 1/10 of the size of the A-row terminal output signals are output to the B terminals, simultaneous use of A (L) and B (H) terminals of the same number is prohibited.
  - 2. Do not connect  $V \square$  and  $COM \square$  for all unused output numbers.

## CS1W-PMV02 Isolated-type Analog Output Unit

## **Terminal Block Diagram**

## Error Processing

#### Outputs Do Not Change.

Probable cause	Remedy
The span adjustment value in the output zero/ span adjustment is set to 0.	Set the span adjustment to the Unit's default value.
The high/low limit is operating.	Set the high/low limit to the Unit's default value.
The output data is set out of range.	Correct the data so that it falls within the range.
All outputs have been turned OFF with the Output OFF Bit.	Turn OFF the Output OFF Bit.

#### Outputs are Not Converted as Intended.

Probable cause	Remedy
The zero/span adjustment or high/low limit value is incorrect.	Check and correct the settings.
An output device's I/O specifications do not conform.	Check the load impedance. Change the remote device.
The rate-of-change limit is too low, and the change is too slow.	Correct the rate-of-change limit setting.

### Outputs are Unstable.

Probable cause	Remedy			
Output signals are being affected by external noise.	Change the connection paths of the output signal lines. (Separate them from sources of noise or use shielded cable.)			

# SECTION 3 Individual Unit Descriptions for CJ Series

This section describes each of the CJ-series Analog I/O Units in detail.

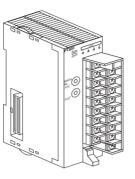

3-1	CJ1W-PTS51 Isolated-type Thermocouple Input Unit	266
3-2	CJ1W-PTS15 Isolated-type Thermocouple Input Unit	278
3-3	CJ1W-PTS52 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)	292
3-4	CJ1W-PTS16 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100, Pt50, Ni508.4)	302
3-5	CJ1W-PDC15 Isolated-type Direct Current Input Unit	314

## 3-1 CJ1W-PTS51 Isolated-type Thermocouple Input Unit

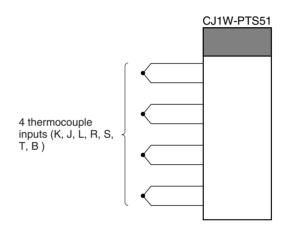

### **Overview**

The CJ1W-PTS51 Isolated-type Thermocouple Input Unit provides four direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

CJ1W-PTS51

## System Configuration

## Features

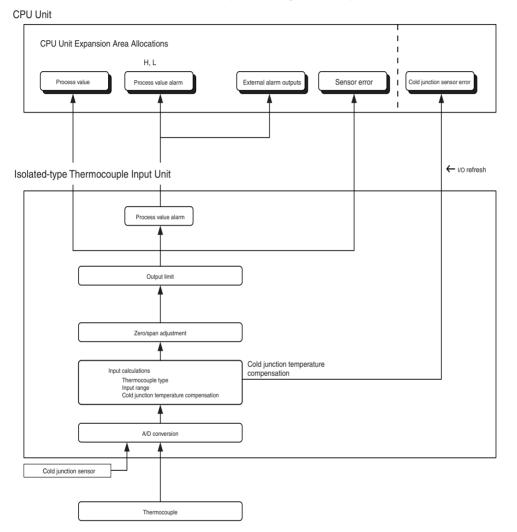

- Up to four Thermocouples can be connected for each Unit. (The temperature sensor and input range settings are the same for all four inputs.)
- There is isolation between channels, so unwanted circuit paths between thermocouple inputs can be prevented.
- A variety of temperature specifications are supported. Any of the following can be selected for thermocouple input: K, J, L, R, S, T, B (Decimal points can be selected for K, J, and L.)
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Binary or BCD can be selected for the data output format.)
- Process value alarm (with two internal alarms in memory and one external alarm output for each input)
- Alarm ON-delay timer and hysteresis for process value
- Zero/span adjustment capability during operation
- Sensor error detection
- Maximum or minimum process value can be specified for when a sensor error is detected.

### **Model Information**

Unit classification	Model number	Inputs	Temperature sensor types
CJ-series Spe- cial I/O Unit	CJ1W-PTS51	4	K, J, L, R, S, T, B (The same sensor type is used for all four inputs.)

## Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

## **Specifications**

Item		Specifications				
Model		CJ1W-PTS51				
Applicable PLC		CJ Series				
Unit classification		CJ-series Special I/O Unit				
Mounting positio	n	CJ-series CPU Rack or CJ-series Expansion Rack				
Maximum numbe	er of Units	40 (within the allowable current consumption and power consumption range)				
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)				
Areas for data	Special I/O Unit	10 words/Unit				
exchange with CPU Unit	Area	Thermocouple Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flag, sensor errors, cold junction sensor errors				
	DM Area words	100 words/Unit				
	allocated to Special I/O Units	CPU Unit to Thermocouple Input Unit: Temperature sensor type, input range (same for all I/O), process value alarm setting (L, H), zero/span adjustment value.				
Number of tempo inputs	erature sensor	4				
Temperature ser	nsor types	Selectable from K, J, L, R, S, T, B. (Same setting for all inputs.)				
Data storage in t	the CIO Area	The actual process data in the input range is stored in four digits hexadecimal (binary or BCD values) in the allocated words in the CIO Area.				
Accuracy (25°C)	(See note.)	With celsius selected: $\pm 0.3\%$ of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit max.				
		With fahrenheit selected: $\pm 0.3\%$ of PV or $\pm 2^{\circ}$ F, whichever is greater, $\pm 1$ digit max.				
		However, the accuracy of K and T at $-100^{\circ}$ C or lower and L is $\pm 2^{\circ}$ C $\pm 1$ digit max.				
		The accuracy of R and S at 200°C or lower is $\pm 3^{\circ}C \pm 1$ digit max.				
		The accuracy of B at 400°C or lower is not specified.				
		PV: Process value data				
Temperature cha	aracteristics	Refer to Temperature Characteristics According to Thermocouple Type on page 270.				
Warmup time		30 min				
Conversion period	bd	250 ms/4 inputs.				
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle				
Sensor error det	ection	Detects sensor error at each input and turns ON the Sensor error Flag.				
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: +20 digit of set input range; low: -20 digit of set input range)				
Function	Process value alarm	Process value 2-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s) are available. External alarm outputs: One per input (H or L).				
External alarm outputs		NPN outputs (with short-circuit protection) External power supply voltage: 20.4 to 26.4 V DC Max. switching capacity: 100 mA (for one output) Leakage current: 0.3 mA max. Residual voltage: 3 V max.				
Isolation		Between inputs and PLC signal: Transformer for power supply and photocoupler for signals				
		Between each input: Transformer for power supply and photocoupler for signals.				
Insulation resistance		20 M $\Omega$ max. (at 500 V DC).				
		Between all output and NC terminals and external AC terminals (Power Supply Unit)				
		Between all input terminals and external AC terminals (Power Supply Unit)				
		Between all input terminals and all output terminals				
		Between all external DC terminals (input, output, and NC terminals) and FG plate				
		Between all input and output terminals and all NC terminals				

Item	Specifications
Dielectric strength	Between all output and NC terminals and external AC terminals (Power Supply Unit) 2,000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all input terminals and external AC terminals (Power Supply Unit)
	Between all input terminals and all output terminals
	Between all external DC terminals (input, output, and NC terminals) and FG plate 1,000 VAC, 50/60 Hz 1 min., detection current: 1 mA
	Between all channels
	500 VAC, 50/60 Hz 1 min., detection current: 1mA
External connections	Terminal block (detachable)
Unit number settings	Set by rotary switches on front panel, from 0 to 95.
Indicators	Seven LED indicators on front panel (for normal operation, errors detected at the Thermocouple Input Unit, errors related to the CPU Unit, and four indicators for external alarm outputs.)
Alarm time for CPU Unit cycle time	0.4 ms
Current consumption (supplied from Power Supply Unit)	5 V DC at 250 mA max.
Dimensions	$31 \times 90 \times 65 \text{ mm} (W \times H \times D)$
Weight	150 g max.

## Sensor Type and Input Range

The Temperature Sensor type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input	°C			°F			
ting		16-bit binary	BC	D	16-bit binary	BCD		
			F indicates minus sign.	Leftmost bit indicates minus sign.		F indicates minus sign.	Leftmost bit indicates minus sign.	
0		0514			FED4 to FFFF to 08FC (-300 to -1 to 2300)	F300 to 2300 (-300 to 2300)	F300 to 2300 (–300 to 2300)	
1	K: 0.0 to 500°C (0.0 to 900.0°F)		0000 to 5000 (0.0 to 500.0)		0000 to 2328 (0.0 to 900.0)	0000 to 9000 (0.0 to 900.0)		
2	J: −100 to 850°C (−100 to 1500°F)			8100 to 0850 (-100 to 850)	FF9C to FFFF to 05DC (–100 to –1 to 1500)	F100 to 1500 (–100 to 1500)	8100 to 1500 (–100 to 1500)	
3	J: 0.0 to 400.0°C (0.0 to 750.0°F)				0000 to 1D4C (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	
4	700.0°F)	0FA0 (–200.0 to –0.1 to	(See note 3.)	(–200.0 to	F448 to FFFF to 1B58 (–300.0 to –0.1 to 700.0)	F999 to 7000 (See note 3.) (–99.9 to 700.0)	B000 to 7000 (-300.0 to 700.0)	
5	L: -100 to 850°C (-100 to 1500°F)			8100 to 0850 (-100 to 850)	FF9C to FFFF to 05DC (–100 to –1 to 1500)	F100 to 1500 (–100 to 1500)	8100 to 1500 (–100 to 1500)	
6	L: 0.0 to 400.0°C (0.0 to 750.0°F)				0000 to 1D4C (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	0000 to 7500 (0.0 to 750.0)	
7	R: 0 to 1700°C (0 to 3000°F)				0000 to 0BB8 (0 to 3000)	0000 to 3000 (0 to 3000)	0000 to 3000 (0 to 3000)	

Set-	Input	°C			°F		
ting		16-bit binary	BCD		16-bit binary BCD		CD
			F indicates minus sign.	Leftmost bit indicates minus sign.		F indicates minus sign.	Leftmost bit indicates minus sign.
8							0000 to 3000 (0 to 3000)
9	B: 400 to 1800°C (See note 2.) (750 to 3200°F)		0400 to 1800 (400 to 1800)			0750 to 3200 (750 to 3200)	

- Note 1. If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.
  - 2. The lower limit for B thermocouples is 0°C/°F.
  - The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs. For 0.1°C/0.1°F indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9. For 0.1°C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

#### **Temperature Characteristics According to Thermocouple Type**

Thermocouple	Temperature range	Set value error when ambient temperature changes by 1°C
R	0 to 200 °C	±0.43°C
	200 to 1,000°C	±0.29°C
	1,000 to 1,700°C	±285 ppm of PV
S	0 to 200 °C	±0.43°C
	200 to 1,000°C	±0.29°C
	1,000 to 1,700°C	285 ppm of PV
В	400°C or less	Not specified.
	400 to 800°C	±0.43°C
	800 to 1,000°C	±0.29°C
	1,000 to 1,800°C	285 ppm of PV
К	–200 to –100°C	±0.29°C
	–100 to 400°C	±0.11°C
	400 to 1,300°C	±285 ppm of PV
J	–100 to 400°C	±0.11°C
	400 to 850°C	±285 ppm of PV
Т	–200 to –100°C	±0.29°C
	-100 to 400°C	±0.11°C
L	-100 to 400°C	±0.11°C
	400 to 850°C	±285 ppm of PV

The measured temperature error is calculated as shown in the following example.

Item	Details
Ambient temperature	30°C
Thermocouple type	К
Measured temperature (PV)	500°C

Item	Details
Reference accuracy (25°C)	$\pm 0.3^{\circ}$ C of PV or $\pm 1^{\circ}$ C, whichever is greater, $\pm 1$ digit.
	In this example, $\pm 1.5^{\circ}$ C.
Temperature characteristics	400 to 1,300°C: 285 ppm of PV.
	In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient temper- ature	5°C (25 to 30°C).

Overall accuracy =

Reference accuracy + Temperature characteristic x Change in ambient temperature =  $\pm 1.5^{\circ}C + \pm 0.143^{\circ}C \times 5$  = Approx.  $\pm 2.2^{\circ}C \pm 1$  digit.

### **DM Area Allocations**

First word: m = D20000 + unit number × 100 (unit number: 0 to 95)

	DM Area address		Data range		Default	Data contents

							Sensor type
m + 19				0 to 9	0000 to 0009 hex	0 (0000 hex)	0: K, 1: K (with decimal point), 2: J, 3: J (with decimal point), 4: T, 5: L, 6: L (with decimal point), 7: R, 8: S, 9: B

DM Area address			Data range		Default	Data contents	
Input No. 1	Input No. 2	Input No. 3	Input No. 4	Decimal	Hexadecimal		
		:		:	•		External alarm output mode
m + 20	m + 23	m + 26	m + 29	0, 1	0000, 0001 hex	0 (0000 hex)	Select either high limit or low limit alarm out- put. 0: High limit alarm; 1: Low limit alarm
		•			•		Alarm hysteresis
m + 21	m + 24	m + 27	m + 30	0 to 9999	0000 to 270F hex	0 (0000 hex)	set value × 0.1
		•					Alarm ON-delay time
m + 22	m + 25	m + 28	m + 31	0 to 60	0000 to 003C hex	0 (0000 hex)	Unit: s
m+32				0, 1	0000, 0001 hex	1 (See note 3.)	Span adjustment mode 0: 1/1,000 1: 1/10,000

- Note 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area). The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.
  - 2. The operation settings are shown in the following table.

Word	Bits	Description	Settings
m+18	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 contains 1000.

3. Indicates the value after transferring the default value (set when 12345 is written to word m).

	n + 2	00 to 15	Input No. 2		input.	range specified for each input type ±20 digits.
	n + 3	00 to 15	Input No. 3			input type ±20 digits.
	n + 4	00 to 15	Input No. 4			
Thermocouple	n + 5	00 to 15	Not used.			
Input Unit to CPU Unit	n + 6	00 to 15				
	n + 7	00 to 15				
	n + 8	00 to 15				
	n + 9	00	Input No. 1	Sensor error	0, 1	0: Normal
		01	Input No. 2		0, 1	1: Error
		02	Input No. 3		0, 1	
		03	Input No. 4		0, 1	
		04 to 07	Not used.			
		08	Cold junctior	n sensor error	0, 1	0: Normal 1: Error
		09 to 14	Not used.			
		15	Conversion ( (See note.)	data enabled flag	0, 1	0: Data disabled 1: Data enabled

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

### **Terminal Connection Diagram**

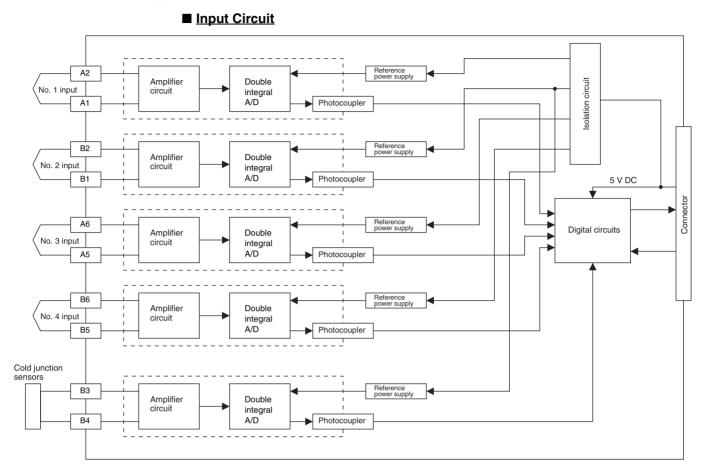

Note Action for Unused Input Terminals

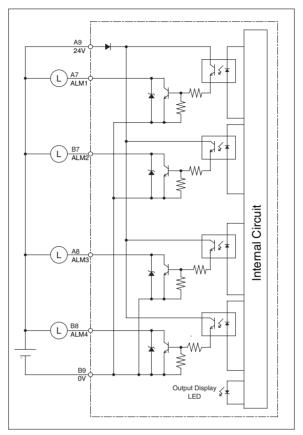

- Short-circuit the positive (+) and negative (-) sides of the thermocouple input section using a lead wire. For example, short terminals A3 and A2 for No. 1 thermocouple input.
- Cold junction sensors are mounted before shipment. If one of the cold junction sensors is disconnected, cold junction compensation will stop and correct measurement of temperatures cannot be made. Always make sure the cold junction sensors are connected when using the Units.
- Cold junction sensors are calibrated separately for each Unit and connected circuit, so correct temperatures will not be measured if a cold junction sensor from another Unit is used or if the two cold junction sensors in a Unit are swapped. Use the cold junction sensors as they are provided, without making any changes.
- Do not connect anything to NC terminals. Do not use NC terminals as relay terminals.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

## Section 3-1

## **Terminal Block Diagram**

### ■ Output Circuit

# Error Processing

#### **Conversion Data Does Not Change.**

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The sensor type is not set cor- rectly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a sensor error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type is not set cor- rectly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.

Probable cause	Remedy
Cold junction compensation is not operating.	Check the Cold Junction Error Flag.
A compensation conductor has not been used or a different com- pensation conductor is used.	Use the correct compensation conductor for the thermocouple.
Incorrect input wiring (incorrect thermocouple or compensation conductor polarity.)	Correct the input wiring.
Thermocouple lead or compensat- ing conductor is too long and mea- surements are being affected by conductor resistance.	Use a thicker compensating conductor. Change the wiring position and shorten the com- pensating conductor.
The terminal block temperature is not uniform due to radiated heat from peripheral devices.	Mount the unit in a position unaffected by radiated heat.

#### Converted Values are Unstable.

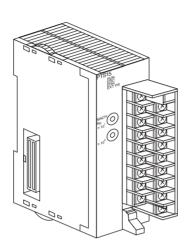

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert a 0.01 to 0.1 $\mu$ F ceramic capacitor between the positive (+) and negative (-) input terminals.
An airflow is hitting the Unit termi- nal block.	Move the terminal block to a position unaffected by airflow.

# 3-2 CJ1W-PTS15 Isolated-type Thermocouple Input Unit

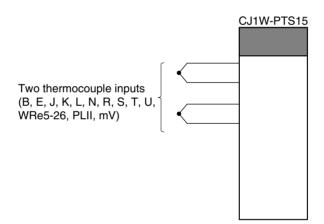

### **Overview**

The CJ1W-PTS15 Isolated-type Thermocouple Input Unit provides two direct thermocouple inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

#### CJ1W-PTS15

## System Configuration

### **Features**

- Up to two Thermocouples can be connected for each Unit. (The temperature sensor and input range settings can be made separately for each of the two inputs.)
- There is isolation between channels, so unwanted circuit paths between thermocouple inputs can be prevented.
- A variety of temperature specifications are supported. Any of the following can be selected for thermocouple input: B, E, J, K, L, N, R, S, T, U, WRe5-26, PLII, mV.
- 1/64,000 resolution for all temperature specifications.
- High-speed conversion of 10 ms/2 inputs.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting (input range set by user).
- Four values for each process value alarm input.
- Alarm ON-delay timer for process value
- Mean value processing.
- Rate-of-change calculation.

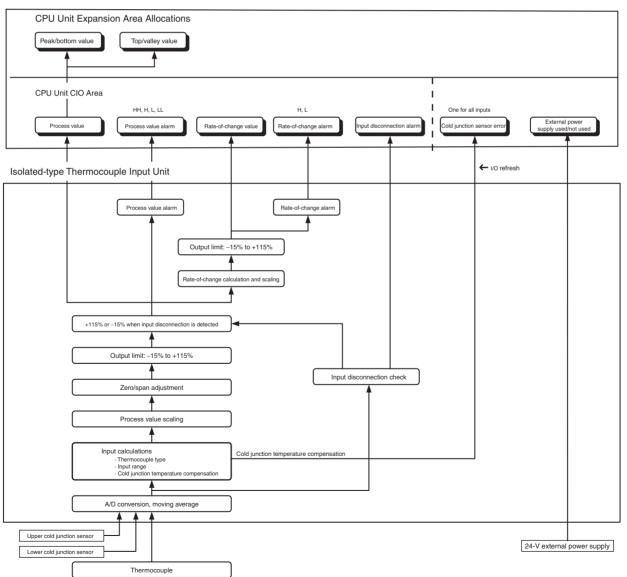

- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- Maximum or minimum process value can be specified for when a disconnection is detected.
- Adjustment period control.
- Peak and bottom detection.
- Top and valley detection.

### **Model Information**

Unit classification	Model number	Inputs	Input types
CJ-series Special I/O Unit	CJ1W-PTS15		B, E, J, K, L, N, R, S, T, U, WRe5-26, PLII, or mV select- able for each input

CPU Unit

# **Specifications**

Model Applicable PLC Unit classification		CJ1W-PTS15
Unit classification		CJ Series
Unit classification		CJ-series Special I/O Unit
Mounting position		CJ-series CPU Rack or CJ-series Expansion Rack
Maximum number	of Units	40 (within the allowable current consumption and power consumption range)
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)
	Special I/O Unit	10 words/Unit
exchange with A CPU Unit	Area	Thermocouple Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), conversion data enabled flags, sensor errors.
	OM Area words	100 words/Unit
-	allocated to Special I/O Units	CPU Unit to Thermocouple Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.
	Expansion Con-	35 words/Unit
	rol/Monitor Area vords	CPU Unit to Thermocouple Input Unit: Hold function selection start/reset, adjustment period control, control bits
		Thermocouple Input Unit to CPU Unit: Adjustment period warnings/notices (for each input), peak and bottom values, top and valley values
	Expansion Set-	46 words/Unit
tı	ting Area words	CPU Unit to Thermocouple Input Unit: Expansion Setting Area settings, adjustment period control, peak and bottom detec- tion, top and valley detection
Number of temper inputs	ature sensor	2
Temperature sensor type		The sensor type, input range, and scaling can be set individually for each of 2 inputs, which are each selectable from B, E, J, K, L, N, R, S, T, U, WRe5-26, PL II, and mV.
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (with the minimum and maximum values set by user) (2 inputs set separately). For example, data can be stored at 0% to 100%.
Data storage in the	e CIO Area	The value derived from carrying out the following processing in order of the actual pro- cess data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area.
(25.0)		1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits
Accuracy (25°C)		$\pm$ 0.05% (Depends on the Sensor used and the measured temperature. Refer to Accuracy by Sensor Type and Measured Temperature Range on page 282 for details.)
Temperature coeff	licient	± 0.01%/°C (For full scale of electromotive force. See note.)
Resolution		1/64000
Cold junction com	•	±1°C, at 20 ±10°C
Maximum signal in	iput	± 120 mV
Input impedance	n datastion our	20 kΩ min. 0.1 μA (typical)
Input disconnection detection cur- rent		
Warmup time		45 min
Response time		100 ms (travel time from input 0% to 90%, for $\pm$ 100 mV step input and with moving average for 4 samples)
Conversion period		10 ms/2 inputs
Maximum time to store data in CPU Unit		Conversion period + one CPU Unit cycle
Disconnection det	ection	Detects disconnections at each input and turns ON the Disconnection Detection Flag.
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a disconnection occurs can be specified. (High: 115% of set input range; low: $-15\%$ of set input range)

ľ	tem	Specifications
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the specified number of process values (1 to 128), and stores that value in the CIO Area as the process value.
	Process value alarm	Process value 4-point alarm (LL, L, H, HH), alarm hysteresis, and ON-delay timer (0 to 60 s) are available.
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).
	Rate-of-change alarm	Rate-of-change 2-point alarm (L, H), alarm hysteresis (shared with process value alarm), and ON-delay timer (0 to 60 s, shared with process value alarm) are available.
	Adjustment period control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and number of days notice have elapsed (allocated in Expansion Setting Area), this function turns ON a warning flag to give notice that it is time for readjustment.
	Peak and bot- tom detection	This function detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF, and stores them in the Expansion Control/Monitor Area.
	Top and valley detection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF, and stores them in the Expansion Control/Monitor Area.
Isolation		Between inputs and PLC signals, and between inputs: Isolation by transformer for power supply, and by photocoupler for signals.
		Cold junction compensation circuit: No isolation from input 2
Insulation resistance		20 MΩ (at 500 V DC) between inputs
Dielectric streng	gth	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.
External connect	ctions	Terminal block (detachable)
Unit number se	ttings	Set by rotary switches on front panel, from 0 to 95.
Indicators Front panel connector		Four LED indicators on front panel (for normal operation, errors detected at the Ther- mocouple Input Unit, errors related to the CPU Unit, and use of external power sup- ply).
		Sensor input connector terminal block (detachable)
Alarm time for CPU Unit cycle time		0.3 ms
Current consumption		5 V DC at 180 mA max.
External power supply		24 VDC +10%/-15% 60 mA max., inrush current: 20 A for 1 ms max. (The external 24-VDC power supply must be isolated.)
Dimensions		$31 \times 90 \times 65 \text{ mm} (W \times H \times D)$
Weight		150 g max.
Standard accessories		Two cold junction sensors (installed in terminal block)

**Note** The method for calculating the error in temperature measurements, including the temperature coefficient, is given below. The "full scale of electromotive force" is the difference between the high limit and low limit converted to electromotive force for each thermocouple.

#### Example Ambient temperature: 30 °C Temperature Sensor: K thermocouple (–270 to 1,372 °C) Measured temperature: 500 °C From electromotive force table

–270 °C:	–6.458 mV
1,372 °C:	<u>54.86 mV</u>
	Full scale: 61.344

Electromotive conversion of temperature coefficient:

 $61.344 \text{ mV} \times \pm 0.01\%^{\circ}\text{C} = \pm 6.13 \,\mu\text{V}^{\circ}\text{C}$ 

Error in electromotive force at 30°C:  $\pm 6.13 \ \mu V/^{\circ}C \times (30^{\circ}C - 25^{\circ}C) = 30.65 \ \mu V/^{\circ}C$ 

Temperature difference between measurement point and terminals on Unit (ambient temperature) (based on ambient temperature of 30 °C and Measured temperature of 500 °C):

470 °C

Electromotive force per °C at a measured temperature of 470 °C (from the electromotive force tables for a K thermocouple):

43 µV/°C

Error in temperature coefficient:  $\pm 30.65 \ \mu\text{V} \div 43 \ \mu\text{V}/^{\circ}\text{C} = \pm 0.7^{\circ}\text{C}$ 

Error in measured temperature = Accuracy  $\pm$  Error from temperature coefficient + Error in cold junction compensation =  $\pm 0.8^{\circ}C + \pm 0.7^{\circ}C + \pm 1.0^{\circ}C = \pm 2.5^{\circ}C$ 

#### Sensor Type and Input Range

The Temperature Sensor type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in the following table. Accuracy and resolution, however, are not determined from the set input range, but rather from the measurable input range shown in the following table. Therefore, accuracy and resolution do not change even when a narrow input range is set.

Sensor type	DM Area setting	Measurable input range
В	0	0 to 1,820°C
E	1	–270 to 1,000°C
J	2	–210 to 1,200°C
К	3	–270 to 1,372°C
Ν	4	–270 to 1,300°C
R	5	–50 to 1,768°C
S	6	–50 to 1,768°C
Т	7	–270 to 400°C
mV	8	-100 to 100 mV
L	9	–200 to 900°C
U	10	–200 to 600°C
WRe5-26	11	0 to 2,300°C
PLII	12	0 to 1,300°C

### Accuracy by Sensor Type and Measured Temperature Range

Sensor type	Temperature range	Standard accuracy	Details
В	0 to 1,820°C	±1.8°C (±0.1%)	400 to 800°C: ±3°C Less than 400°C: Accuracy is not specified.
E	–270 to 1,000°C	±0.6°C (±0.05%)	–250 to 200°C: ±1.2°C Less than –250°C: Accuracy is not specified.
J	–210 to 1,200°C	±0.7°C (±0.05%)	
К	–270 to 1,372°C	±0.8°C (±0.05%)	–250 to 200°C: ±2°C Less than –250°C: Accuracy is not specified.
Ν	–270 to 1,300°C	±0.8°C (±0.05%)	–200 to 150°C: ±1.6°C Less than –200°C: Accuracy is not specified.
R	–50 to 1,769°C	±1.8°C (±0.1%)	0 to 100°C: ±2.5°C Less than 0°C: Accuracy is not specified.
S	–50 to 1,769°C	±1.8°C (±0.1%)	0 to 100°C: ±2.5°C Less than 0°C: 3.2°C
Т	–270 to 400°C	±0.35°C (±0.05%)	-180 to 0°C: ±0.7°C
			-200 to -180°C: ±1.3°C
			Less than -200°C: Accuracy is not specified.

Sensor type	Temperature range	Standard accuracy	Details
L	–200 to 900°C	±0.5°C (±0.05%)	
U	–200 to 600°C	±0.4°C (±0.05%)	−100 to 0°C: ±0.5°C
			Less than -100°C: ±0.7°C
WRe5-26	0 to 2,315°C	±1.2°C (±0.05%)	More than 2,200°C: ±1.4°C
PLII	0 to 1,395°C	±0.7°C (±0.05%)	

# **DM Area Allocations**

Expansion	Setting Area	allocations	-		•	
m+98		0 to 5	0000 to 0005 hex		Expansion Setting 0: Not used; 1: DM	Area allocations: l; 2: CIO; 3: W; 4: H; 5: EM
m+99		0 to 32767	0000 to 7FFF hex		Expansion Setting	Area first word

Note

- The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continuously refreshed area) or 2 (initial settings area), or in the Expansion Setting Area. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal. If the first memory address containing the out-of-range error is in the Expansion Setting Area, the Address of Data Range Error will be over +100 (or +100 if the first word in the Expansion Setting Area is an error).]
  - 2. When specifying an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
  - 3. When specifying the first word in an expansion setting area, be sure that the end of the memory area is not exceeded.

# **Expansion Setting Area**

First word: word o. (o = address specified in word m+99 in the area specified in word m+98 in the DM Area)

DM Area	a address	Data range		Default	Data contents		
Input No. 1	Input No. 2	Decimal	Hexadecimal

	p+20 to p+34		Not used.		0000	Not used.

### **Terminal Connection Diagram**

Note Action for Unused Input Terminals

- Short-circuit the positive (+) and negative (-) sides of the thermocouple input section using a lead wire. For example, short terminals A4 and B5 for No. 2 thermocouple input.
- Cold junction sensors are mounted between A1 and A2, and A6 and A7 before shipment. If one of the cold junction sensors is disconnected, cold junction compensation will stop and correct measurement of temperatures cannot be made. Always make sure the cold junction sensors are connected when using the Units.
- Cold junction sensors are calibrated separately for each Unit and connected circuit, so correct temperatures will not be measured if a cold junction sensor from another Unit is used or if the two cold junction sensors in a Unit are swapped. Use the cold junction sensors as they are provided, without making any changes.
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

### Terminal Block Diagram

#### **Conversion Data Does Not Change.**

•	
Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a wiring disconnection has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The sensor type, input range, or process value scaling is not set correctly.	Check and correct the settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
Cold junction compensation is not operating.	Check the Cold Junction Error Flag.
A compensation conductor has not been used or a different com- pensation conductor is used.	Use the correct compensation conductor for the thermocouple.
Incorrect input wiring (incorrect thermocouple or compensation conductor polarity.)	Correct the input wiring.

#### Converted Values are Unstable.

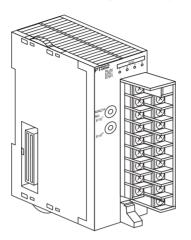

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert a 0.01 to 0.1 $\mu$ F ceramic capacitor between the positive (+) and negative (–) input terminals.
	Increase the number of values for calculating the moving average in mean value processing.
The process value scaling value is greater than the Unit's resolution.	Reduce the process value scaling value.
The input signal range setting is too small.	Match the input signal range to the internal ranges.

# 3-3 CJ1W-PTS52 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100)

### **Overview**

The CJ1W-PTS52 Isolated-type Resistance Thermometer Input Unit provides four direct platinum resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

#### CJ1W-PTS52

## **System Configuration**

Four platinum resistance thermometer inputs (Pt100 (JIS, IEC), JPt100)

CJ1W-PTS5

### **Features**

- Up to four platinum resistance thermometers can be connected for each Unit. (The temperature sensor and input range settings are the same for all four inputs.)
- Pt100 (JIS, IEC), JPt100 can be selected.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal. (Either binary or BCD data output can be selected.)
- Process value alarm (two alarms in internal memory and one external alarm output for each input).
- Alarm ON-delay timer and hysteresis for process value.
- Zero/span adjustment capability during operation.
- Sensor error detection.
- Maximum or minimum process value can be specified for when a sensor error is detected.

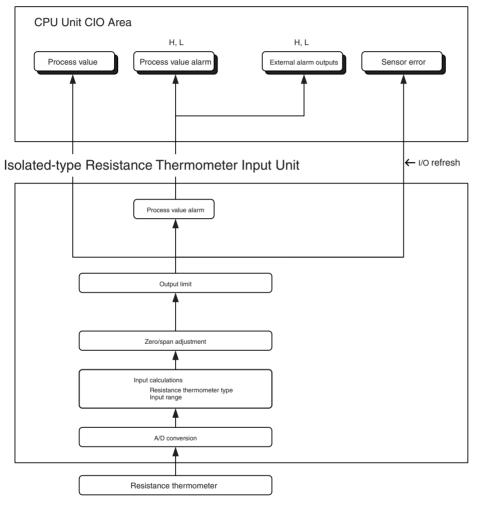

### **Model Information**

Unit classification	Model number	Inputs	Input types
CJ-series Special I/O Unit	CJ1W-PTS52		Platinum resistance thermome- ter Pt100 (JIS, IEC), JPt100

# Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

#### **CPU** Unit

# **Specifications**

Item	Specifications
Model	CJ1W-PTS52
Applicable PLC	CJ Series
Unit classification	CJ-series Special I/O Unit
Mounting position	CJ-series CPU Rack or CJ-series Expansion Rack
Maximum number of Units	40 (within the allowable current consumption and power consumption range)
Unit numbers	00 to 95 (Cannot duplicate Special I/O Unit numbers.)

Item		Specifications			
Areas for data Special I/O Unit		10 words/Unit			
exchange with CPU Unit	Area	Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (L, H), conversion data enabled flags, sensor errors.			
DM Area words allocated to Special I/O Units		100 words/Unit CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), process value alarm setting (L, H), zero/span adjustment value.			
Number of temp inputs	erature sensor	4			
Temperature ser	nsor type	Pt100 (JIS, IEC), JPt100 Sensor type, input range, and scaling to industrial units are the same for all I/O.			
Data storage in	the CIO Area	The actual process data in the input range is stored in four digits hexadecimal (binary or BCD values) in the allocated words in the CIO Area.			
Accuracy (25°C)		$\pm$ 0.3% of PV or $\pm$ 0.8°C, whichever is greater, $\pm$ 1 digit max. $\pm$ 0.3% of PV or $\pm$ 1.6°F, whichever is greater, $\pm$ 1 digit max. PV: Process value data			
Temperature cha	aracteristics	Refer to <i>Temperature Characteristics According to Platinum Resistance Thermometer Type</i> on page 295.			
Sensing method		3-wire method			
Influence of con	ductor resistance	0.4°C/Ω max.			
Warmup time		10 min			
Conversion perio	bd	250 ms/4 inputs			
Maximum time to CPU Unit	o store data in	Conversion period + one CPU Unit cycle			
Sensor error det	ection	Detects sensor error at each input and turns ON the Sensor error Flag.			
		Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a sensor error occurs can be speci- fied. (High: +20 digit of set input range; low: -20 digit of set input range)			
Function	Process value alarm	Process value 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available).			
	External alarm outputs	NPN outputs (with short-circuit protection) External power supply voltage: 20.4 to 26.4 V DC Max. switching capacity: 100 mA (for one output) Leakage current: 0.3 mA max. Residual voltage: 3 V max.			
Isolation		Between inputs and PLC signal: Transformer for power supply and photocoupler for signals			
Insulation resistance		Between each input: Transformer for power supply and photocoupler for signals         20 MΩ max. (at 500 V DC).         Between all output and NC terminals and external AC terminals (Power Supply Unit)         Between all input terminals and external AC terminals (Power Supply Unit)         Between all input terminals and all output terminals         Between all external DC terminals (input, output, and NC terminals) and FG plate         Between all input and output terminals and all NC terminals			
Dielectric strength		Between all output and NC terminals and external AC terminals (Power Supply Unit) 2,000 V AC, 50/60 Hz 1 min., detection current: 1 mA Between all input terminals and external AC terminals (Power Supply Unit)			
		Between all input terminals and all output terminals Between all external DC terminals (input, output, and NC terminals) and FG plate 1,000 V AC, 50/60 Hz 1 min., detection current: 1 mA Between all channels 500 VAC, 50/60 Hz 1 min., detection current: 1 mA			
External connec	tions	Terminal block (detachable)			
		וסודווויומו אוסטת (עבומטוומאוב)			

Item	Specifications			
Unit number settings	Set by rotary switches on front panel, from 0 to 95.			
Indicators	Seven LED indicators on front panel (for normal operation, errors detected at the Resistance Thermometer Input Unit, errors detected at the CPU Unit, and four indicators for external alarm outputs.)			
Alarm time for CPU Unit cycle time	0.4 ms			
Current consumption	5 V DC at 250 mA max			
Dimensions	$31 \times 90 \times 65 \text{ mm} (W \times H \times D)$			
	Note The height including the Backplane is 145 mm.			
Weight	150 g max.			

#### Sensor Type and Input Range

The Platinum Resistance Thermometer type and input range are set in the allocated words in the DM Area for every four inputs.

The measurable data range is  $\pm 20$  digits wider than the sensor input range.

Set-	Input	°C			°F		
ting		16-bit binary	BC	D	16-bit binary	B	CD
			F indicates minus sign.	Leftmost bit indicates minus sign.		Leftmost 4 bits (bits 15 to 12) indicate minus sign.	Leftmost bit (bit 15) indicates minus sign.
0	Pt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	F830 to FFFF to 1964 (–200.0 to –0.1 to 650.0)	(See note 2.)		2EE0	(See note 2.)	B000 to 7999 (See note 2.) (-300.0 to 799.9)
1	JPt100: -200.0 to 650.0°C (-300.0 to 1200.0°F)	F830 to FFFF to 1964 (–200.0 to –0.1 to 650.0)	(See note 2.)		F448 to FFFF to 2EE0 (–300.0 to –0.1 to 1200.0)	(See note 2.)	B000 to 7999 (See note 2.) (-300.0 to 799.9)
2 to 9	Do not set.		•	•	Do not set.	•	

- If the indication range is exceeded, a sensor error will occur and the sensor error bit will turn ON. The process value will be clamped at the lower or upper limit of the indication range, depending on the setting for data direction at sensor error.
  - The indicator range for BCD display will be clamped at the lower (or upper) limit in the region between the lower (or upper) limit of the setting range and the point where a sensor error occurs.
     For 0.1°C/0.1°F indication with minus sign indicated by leftmost 4 bits (bits 12 to 15): Lower limit = -99.9, Upper limit = 999.9.
     For 0.1°C/0.1°F indication with minus sign indicated by leftmost bit (bit 15): Lower limit = -799.9, Upper limit = 799.9.

### Temperature Characteristics According to Platinum Resistance Thermometer Type

Platinum Resistance Thermometer	Temperature range	Set value error when ambient temperature changes by 1°C
Pt100	–200 to 200°C	±0.06°C
	200 to 650°C	285 ppm of PV
JPt100	–200 to 200°C	±0.06°C
	200 to 650°C	285 ppm of PV

The measured temperature error is calculated as shown in the following example.

Item	Details
Ambient temperature	30°C
Platinum Resistance Thermometer	Pt100
Measured temperature (PV)	500°C
Reference accuracy	$\pm 0.3^{\circ}$ C of PV or $\pm 0.8^{\circ}$ C, whichever is greater, $\pm 1$ digit.
(25°C)	In this example, ±1.5°C.
Temperature characteris-	200 to 650°C: 285 ppm of PV.
tics	In this example, 285 ppm $\times$ 500°C = 0.143°C.
Change in ambient tem- perature	5°C (25 to 30°C)

Overall accuracy =

Reference accuracy + Temperature characteristic × Change in ambient temperature =  $\pm 1.5^{\circ}$ C +  $\pm 0.143^{\circ}$ C × 5 = Approx.  $\pm 2.2^{\circ}$ C  $\pm 1$  digit.

## **DM Area Allocations**

				0, 1		(0000 hex)	put. 0: High limit alarm; 1: Low limit alarm
	•	•	•	•	•	•	Alarm hysteresis
m + 21	m + 24	m + 27	m + 30	0 to 9999	0000 to 270F hex	0 (0000 hex)	Set value $\times$ 0.1
							Alarm ON-delay time
m + 22	m + 25	m + 28	m + 31	0 to 60	0000 to 003C hex	0 (0000 hex)	Unit: s
m + 32				0, 1	0000, 0001 hex	1 (See note 3.)	Span adjustment mode 0: 1/1,000 1: 1/10,000

**Note** 1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

Word	Bits	Description	Settings
m+18	00	Temperature unit setting	0: °C
			1: °F
	04	Data format	0: Binary (Negatives are given as 2's complements).
			1: BCD
	08	Minus sign display format for BCD display	0: "F" used to indicate the minus sign.
			1: Leftmost bit used to indicate the minus sign.
			The setting is disabled if bits 04 to 07 are set to 0.
	12	Data direction at sensor error	0: Goes to upper limit at sensor error
			1: Goes to lower limit at sensor error

2. The operation settings are shown in the following table.

Example: For a temperature in degrees celcius (°C), a binary data format, and a data direction at sensor error of "lower limit," word m+18 contains 1000.

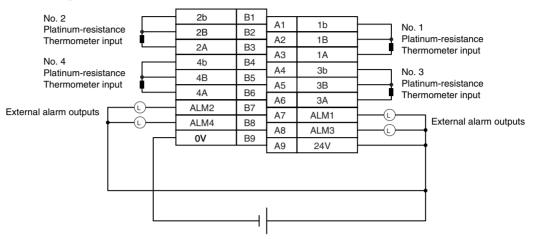

3. Indicates the value after transferring the default value (set when 12345 is written to word m).

**Note** The Conversion Data Enabled Flag remains OFF after the PLC is turned ON or the Unit is restarted until the AD conversion data becomes stable (approximately 2 to 4 s), then is ON during operation.

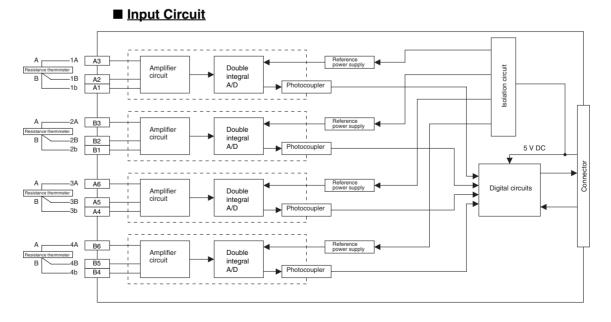

### **Terminal Connection Diagram**

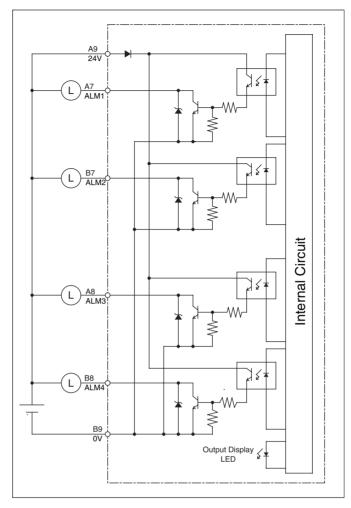

#### Note

- Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - For unused input terminals, connect approximately 100  $\Omega$  between the platinum-resistance thermometer input terminals A and B and short terminals B and b with a lead wire. If resistance is not connected between terminals A and B and terminals B and b are shorted or if terminals A and B and terminals B and b are left open, the alarm output will turn ON and the ALM indicator will light.
  - Always ground the GR terminal on the Power Supply Unit of the PLC.
  - If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

#### **Terminal Block Diagram**

### Output Circuit

# Error Processing

### Conversion Data Does Not Change.

Probable cause	Remedy		
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.		
The sensor type is not set cor- rectly.	Check and reset the sensor type.		
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the resistance has changed. Check for faulty or disconnected wiring. Check whether a sensor error has been detected in the I/O Area.		

#### Values are Not Converted as Intended.

Probable cause	Remedy			
The sensor type is set incorrectly.	Check and reset the sensor type settings.			
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.			
The platinum-resistance thermom- eter input wiring is faulty.	Check and correct the input wiring.			
The compensating conductor is too long and measurements are being affected by conductor resistance.	Use a thicker compensating conductor.			

#### Converted Values are Unstable.

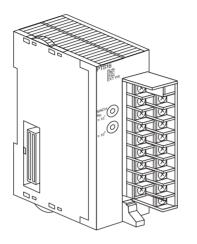

Probable cause	Remedy		
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)		

# 3-4 CJ1W-PTS16 Isolated-type Resistance Thermometer Input Unit (Pt100, JPt100, Pt50, Ni508.4)

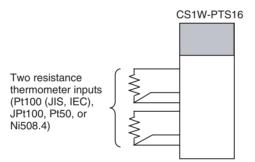

### **Overview**

The CS1W-PTS16 Isolated-type Resistance Thermometer Input Unit provides two direct resistance thermometer inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

#### CS1W-PTS16

# System Configuration

### Features

- Up to two resistance thermometers can be connected for each Unit (with two separate settings for temperature sensors and input ranges).
- Pt100 (JIS, IEC), JPt100, Pt50, or Ni508.4 can be selected.
- 1/64,000 resolution for all temperature specifications.
- High-speed conversion of 10 ms/2 inputs.
- Temperature sensor values are transmitted to the CPU Unit in four digits hexadecimal.
- Variable input range setting.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Zero/span adjustment capability during operation.
- Disconnection detection.
- Maximum or minimum process value can be specified for when a disconnection is detected.
- Adjustment period control.

- Peak and bottom detection.
- Top and valley detection.

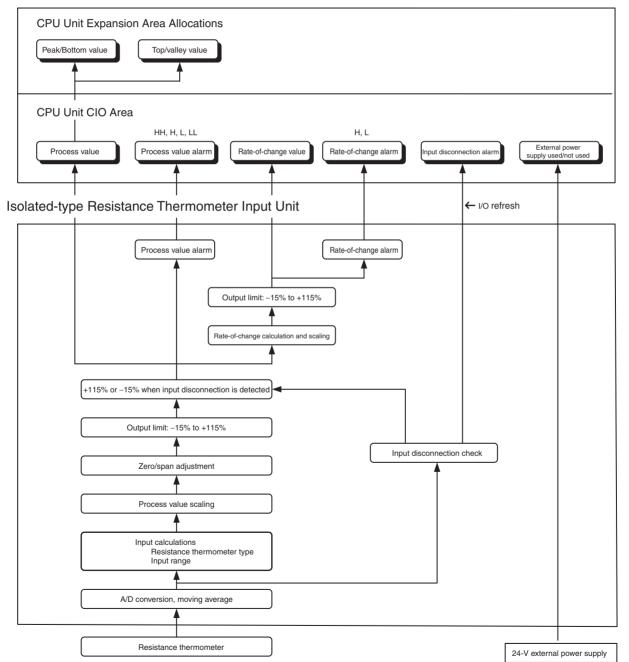

### **Model Information**

Unit classification	Model number	Inputs	Input types	
CJ-series Special I/O Unit	CJ1W-PTS16	2	Resistance thermometer Pt100 (JIS, IEC), JPt100, Pt50, or Ni508.4	

## Block Diagram (Order of Processing)

The processing for the inputs is as shown in the following diagram.

#### **CPU Unit**

# **Specifications**

Item		Specifications			
Model		CJ1W-PTS16			
Applicable PLC		CJ Series			
Unit classificatio	n	CJ-series Special I/O Unit			
Mounting position		CJ-series CPU Rack or CJ-series Expansion Rack			
Maximum number of Units		40 (within the allowable current consumption and power consumption range)			
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)			
Areas for data Special I/O Unit		10 words/Unit			
exchange with CPU Unit	Area	Resistance Thermometer Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, adjustment period end/notices.			
	DM Area words allocated to Special I/O Units	100 words/Unit CPU Unit to Resistance Thermometer Input Unit: Temperature sensor type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, rate-of-change input range, scaling of rate-of- change data, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value.			
	Expansion Con-	35 words/Unit			
	trol/Monitor Area words	CPU Unit to Resistance Thermometer Input Unit:

		Resistance Thermometer Input Unit to CPU Unit:			
		Adjustment period warnings/notices, peak and bottom values, top and valley values			
	Expansion Set-	46 words/Unit			
	ting Area words	CPU Unit to Resistance Thermometer Input Unit:			
		Expansion Setting Area settings, adjustment period control, peak and bottom detec- tion, top and valley detection			
Number of temp inputs	erature sensor	2			
Temperature ser	nsor type	Pt100 (JIS, IEC), JPt100, Pt50, Ni508.4			
		Sensor type, input range, and scaling to industrial units are separate for each of the 2 inputs.			
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (with the minimum and maximum values set by user) (2 inputs set separately.). Data can be stored at 0% to 100%.			
Data storage in t	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Output limits			
Accuracy (25°C)		The greater of the following: $\pm 0.05\%$ or $\pm 0.1^{\circ}C$			
Temperature coefficient		Pt100: 0.009%/°C JPt100: 0.01%/°C Pt50: 0.02%/°C Ni508.4: 0.012%/°C			
Resolution		1/64,000			
Sensing method		3-wire method			
Allowable lead wire resistance		20 $\Omega$ max. per wire			
Input detection current		0.5 mA			
Warmup time		10 min			
Response time		100 ms (travel time from input 0% to 90%, for step input and with moving average for 4 samples)			
Conversion perio	bc	10 ms/2 inputs			
Maximum time to store data in CPU Unit		Conversion period + one CPU Unit cycle			

Disconnection detec	ction	Detects disconnections at each input and turns ON the Disconnection Detection Flag. Hardware detection time: Approx. 0.5 s max. The process value overrange direction for when a disconnection occurs can be speci-			
Function	an value pro-	The process value overrange direction for when a disconnection occurs can be speci-			
Europhian A4-	an value nro-				
	ssing (input	Calculates the moving average for the specified number of process values (1 to 1 and stores that value in the CIO Area as the process value.			
	ocess value arm	Process value 4-point alarm (HH, H, LL, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available).			
	ite-of-change Iculation	Calculates the amount of change per comparison time interval (1 to 16 s).			
	ate-of-change arm	Rate-of-change 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available, shared with process value alarm).			
	ljustment riod control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and the notice of days remaining have elapsed, this function turns ON a warning flag to give notice that it is time for readjustment.			
-	ak and bot- n detection	Detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the peak and bottom values in the Expansion Control/Monitor Area.			
	p and valley tection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the top and valley values in the Expansion Control/Monitor Area.			
Isolation		Between temperature inputs and between input terminals and PLC signals: Power supply isolated by transformers, signals isolated by photocouplers.			
Insulation resistance	e	20 M $\Omega$ (at 500 V DC) between inputs			
Dielectric strength		Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.			
External connection	IS	Terminal block (detachable)			
Unit number settings	S	Set by rotary switches on front panel, from 0 to 95.			
Indicators		Four LED indicators on front panel (for normal operation, errors detected at the Resistance Thermometer Input Unit, errors detected at the CPU Unit, and use of external power supply).			
Front panel connector		Sensor input connector terminal block (detachable)			
Alarm time for CPU Unit cycle time		0.3 ms			
Current consumption		5 V DC at 180 mA max.			
External power supply		24 VDC +10%/-15% 70 mA max., inrush current: 20 A for 1 ms max. (The external 24-VDC power supply must be isolated.)			
Dimensions		$31 \times 90 \times 65 \text{ mm} (W \times H \times D)$			
Weight		150 g max.			
Standard accessorie	es	None			

### Sensor Type and Input Range

The resistance thermometer type and input range are set in the allocated words in the DM Area for every four inputs. The input range can be set anywhere within the measurable input ranges shown in the following table. Accuracy and resolution, however, are not determined from the set input range, but rather from the measurable input range shown in the following table. Therefore, accuracy and resolution do not change even when a narrow input range is set.

Sensor type	DM Area setting	Measurable input range	
Pt100	0	–200 to 850°C	
JPt100	1	–200 to 500°C	

Sensor type	DM Area setting	Measurable input range	
Pt50	2	–200 to 649°C	
Ni508.4	3	–50 to 150°C	

## **DM Area Allocations**

First word: word m. m = D20000 + unit number  $\times$  100 (unit number: 0 to 95)

DM Area address		Data range		Default	Data contents
Input No. 1	Input No. 2	Decimal	Hexadecimal	1	
m		12345, 0	3039, 0000 hex	0000 hex	<ul> <li>Default block read command Specifies the direction of data transfer when the PLC is turned ON or the Unit is restarted for DM Area words m+1 to m+93.</li> <li>12345 (3039 hex): The data in words m+1 to m+93 is transferred from the Resistance Thermometer Input Unit to the CPU Unit. When the transfer is completed, the value will become 0000 hex.</li> </ul>
					• Other than 12345 (3039 hex) (such as 0000 hex): The data in the allocated words of DM Area is transferred from the CPU Unit to the Resistance Thermometer Input Unit.
m+1				0 (0000 hex)	Not used.
	up 1 (continuc peration mode		area): Parameters	that are continu	ously refreshed during PLC operation (regardless of the
					Process value alarm settings
m + 2	m + 10	-32768 to 32767	8000 to FFFF hex, 0000 to 7FFF hex	4200 (1068 hex)	Process value HH (high high limit) alarm setting (Set at process value scaling value.)
m + 3	m + 11	-32768 to 32767	8000 to FFFF hex, 0000 to 7FFF hex	4000 (0FA0 hex)	Process value H (high limit) alarm setting (Set at process value scaling value.)
m + 4	m + 12	-32768 to 32767	8000 to FFFF hex, 0000 to 7FFF hex	0 (0000 hex)	Process value L (low limit) alarm setting (Set at process value scaling value.)
m + 5	m + 13	-32768 to 32767	8000 to FFFF hex, 0000 to 7FFF hex	–200 (FF38 hex)	Process value LL (low low limit) alarm setting (Set at process value scaling value.)
		•	•	•	Rate-of-change value alarm settings

Display para	meter					
		0 to 99, 100 to 1XX	0000 to 0063 hex, 0064 to 0XXX hex	0 (0000 hex)	Address of Data	Range Error (See note.)
Expansion S	Setting Area a	llocation setting	IS			
m+98		0 to 5	0000 to 0005 hex			ng Area allocation M; 2: CIO; 3: W; 4: H; 5: EM
m+99		0 to 32767	0000 to 7FFF hex		First word for Exp	pansion Setting Area

Note

1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 or 2, or in the Expansion Setting Area. The offset from word m to the first word containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal. For more information, refer to *1-6 Error Processing*.

If the first memory address where the out-of-range error occurred is in the Expansion Setting Area, the Address of Data Range Area will be +100 or later. If the first word of the Expansion Setting Area has the error, the Address of Data Range Area will be +100.

- 2. When specifying an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
- 3. When specifying the first word in an expansion setting area, be sure that the end of the memory area is not exceeded.

### Expansion Setting Area Allocations

First word: word o. o = address specified in word m+99 in the area specified by word m+98 in the DM Area.

Section 3-4

DM Area	address	Data range		Default	Data contents
Input No. 1	Input No. 2	Decimal	Hexadecimal		
Input Unit if v	vord m contain		45, and if Expansi		ne from the CPU Unit to the Resistance Thermometer ettings are allocated, when the PLC is turned ON or the
					Expansion Control/Monitor Area settings
0		0 to 5	0000 to 0005 hex		Expansion Control/Monitor Area allocation 0: Not used. 1: DM; 2: CIO; 3: W; 4: H; 5: EM
o+1		0 to 32767	0000 to 7FFF hex		Expansion Control/Monitor Area first word
					Zero/span adjustment supplement
0+2	0+13	0 to 32000	0000 to 7D00 hex	1000 (2710 hex)	Span adjustment position (Input span percentage)
0+3	o+14	-32000 to 32000	8300 to FFFF hex, 0000 to 7D00 hex	0 (0000 hex)	Zero adjustment position (Input span percentage)
0+4	0+15	0 to 9999	0000 to 270F hex	365 (016D hex)	Zero/span adjustment period (Unit: Days)
0+5	o+16	0 to 9999	0000 to 270F hex	30 (001E hex)	Notice of days remaining (Unit: Days)
		•	•		Not used.
o+6 to o+8	o+17 to o+19			0 (0000 hex)	Not used.
		•	•		Top and valley hold
0+9	o+20	0 to 32000	0000 to 7D00 hex	40 (0028 hex)	Hysteresis
					Not used.
o+10 to o+12	o+21 to o+23			0 (0000 hex)	Not used.

Note

1. When specifying an expansion control/monitor area be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.

2. When specifying the first word in an expansion control/monitor area be sure that the end of the memory area is not exceeded.

### **CIO Area Allocations**

First word: word n. n =  $2000 + unit number \times 10$  (unit number: 0 to 95)

Direction	Word	Bit		Name	Data range	Contents	
Resistance Ther- mometer Input	n	00	Input No. 1	Process value LL (low low limit) alarm	0, 1	0: Process value > Set value 1: Process value ≤ Set value 0: Process value < Set value 1: Process value ≥ Set value	
Unit to CPU Unit		01		Process value L (low limit) alarm	0, 1		
		02		Process value H (high limit) alarm	0, 1		
		03		Process value HH (high high limit) alarm	0, 1		
		04	04	Input No. 2	Process value LL (low low limit) alarm	0, 1	Same as for input No. 1.

	p+5	00 to 15		Year and month of final adjustment date	0001 to 9912 (BCD)	span adjustment bit has never been ON.
	p+6	00 to 15	Input No. 2	Day of final adjustment date	0100 to 3100 (BCD)	
	p+7	00 to 15		Year and month of final adjustment date	0001 to 9912 (BCD)	
	p+8 to p+15		Not us	sed.	0	Not used.
	p+16	00 to 15	Input No. 1	Peak/top value	-32728 to +32767 (8000 to FFFF hex, 0000 to 7FFFHex)	Counts the num- ber of repetitions of conditional opera- tions set in the Expansion Setting Area.
	p+17	00 to 15		Bottom/valley value	-32728 to +32767 (8000 to FFFF hex, 0000 to 7FFFHex)	The bottom or val- ley value is stored according to the scaling set in the DM Area.
	p+18	00 to 15	Input No. 2	Peak/top value	-32728 to +32767 (8000 to FFFF hex, 0000 to 7FFFHex)	Same as for Input No. 1.
	p+19	00 to 15		Bottom/valley value	-32728 to +32767 (8000 to FFFF hex, 0000 to 7FFFHex)	
	p+20 to p+34		Not us	sed.	0 (0000Hex)	Not used.

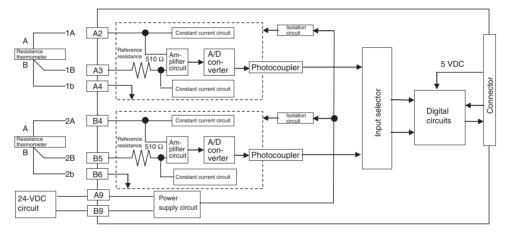

### **Terminal Connection Diagram**

Note

- Wire the same length to A, B, and b, so that the impedance will be the same. In particular, do not short circuit between B and b at the terminal block.
  - For unused input terminals, short-circuit between A–B and B–b (e.g., B4– B5 and B5–B6 for input No. 2) of the resistance thermometer inputs with the lead wire.
  - Always ground the GR terminal on the Power Supply Unit of the PLC.
  - If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.

### **Terminal Block Diagram**

### Error Processing

#### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum process value scaling correctly.
The sensor type, or process value scaling is not set correctly.	Check and reset the sensor type, and the pro- cess value scaling settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir- ing. Check whether a disconnection has been detected in the I/O Area.

Probable cause	Remedy
The sensor type, or process value scaling is set incorrectly.	Check and reset the sensor type, and the pro- cess value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The resistance thermometer input wiring is faulty.	Check and correct the input wiring.

Section 3-4

### Converted Values are Unstable.

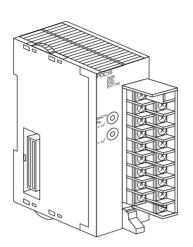

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Increase the number of values for calculating the moving average in mean value processing.
The scaling value is greater than the Unit's resolution.	Reduce the process value scaling.
The input signal range is too small.	Change to match the internal range.

# 3-5 CJ1W-PDC15 Isolated-type Direct Current Input Unit

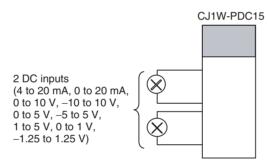

### **Overview**

The CJ1W-PDC15 Isolated-type Direct Current Input Unit provides two directcurrent inputs, and sends the data to the CPU Unit each cycle. All inputs are isolated.

### CJ1W-PDC15

### System Configuration

### **Features**

- Up to two DC inputs can be made to each Unit. 4 to 20 mA, 0 to 20 mA, 0 to 10 V, -10 to 10 V, 0 to 5 V, -5 to 5 V, 1 to 5 V, 0 to 1.25 V, or -1.25 to 1.25 V can be selected separately for each input.
- Resolution of 1/64,000 for all input range specifications.
- High-speed conversion, at 10 ms/2 inputs.
- Scaling values are transmitted to the CPU Unit in four digits hexadecimal.
- There is isolation between channels, so unwanted signal paths between input signals can be prevented.
- Square root function.
- Four values for each process value alarm input.
- ON-delay timer for process value alarm.
- Mean value processing.
- Rate-of-change calculation.
- Two values for each rate-of-change alarm input.
- Input error detection.
- Zero/span adjustment capability during operation.
- Adjustment period control.
- Peak and bottom detection.
- Top and valley detection.

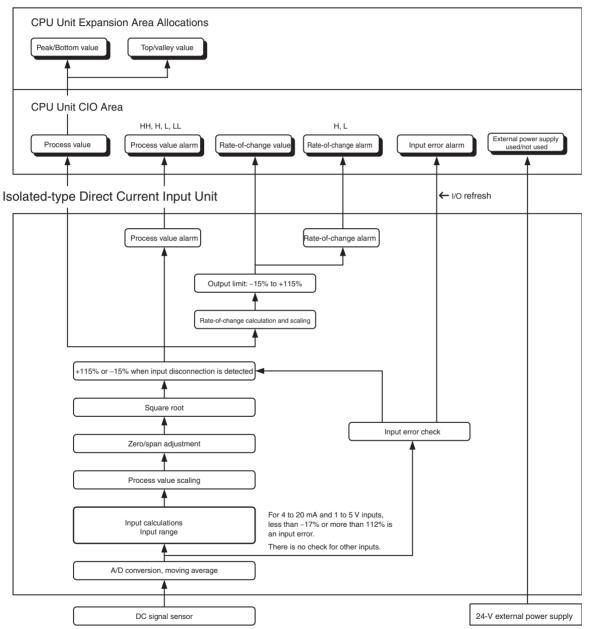

• Integral value calculation.

### **Model Information**

Unit classification	Model number	Inputs	Input types
CJ-series Special I/O Unit	CJ1W-PDC15		4 to 20 mA, 0 to 20 mA, 0 to 10 V, -10 to 10 V, 0 to 5 V, -5 to 5 V, 1 to 5 V, 0 to 1.25 V, and -1.25 to 1.25 V (separate for each input)

**CPU Unit** 

### **Specifications**

Item	Specifications
Model	CJ1W-PDC15
Applicable PLC	CJ Series
Unit classification	CJ-series Special I/O Unit

Item		Specifications		
Mounting position	n	CJ-series CPU Rack or CJ-series Expansion Rack		
Maximum numb	er of Units	40 (within the allowable current consumption and power consumption range)		
Unit numbers		00 to 95 (Cannot duplicate Special I/O Unit numbers.)		
Areas for data exchange with CPU Unit	Special I/O Unit Area	10 words/Unit Direct Current Input Unit to CPU Unit: All process values, process value alarms (LL, L, H, HH), rate-of-change values, rate- of-change alarms (L, H), disconnection alarms, cold junction sensor errors, adjust- ment period end/notice		
	DM Area words	100 words/Unit		
	allocated to Special I/O Units	CPU Unit to Direct Current Input Unit: Input signal type, scaling of process value in industrial units, process value alarm set- ting (L, H), inrush input upper limit, inrush input upper limit time, zero/span adjustment value, Square root function.		
		Temperature input signal type, input range (user set), scaling of process value data to be stored in allocated words in CIO area, rate-of-change input range, scaling of rate-of-change data, number of items for moving average, process value alarm setting (LL, L, H, HH), rate-of-change alarm setting (L, H), zero/span adjustment value		
	Expansion Con- trol/Monitor Area	35 words/Unit CPU Unit to Direct Current Input Unit: Bits for beginning or resetting the hold function selection, adjustment period control, control bits Direct Current Input Unit to CPU Unit: Adjustment period notices, peak and bottom values, top and valley values, integral val- ues		
	Expansion Set- ting Area	46 words/Unit CPU Unit to Direct Current Input Unit: Expansion Setting Area settings, adjustment period control, peak and bottom detec- tion, top and valley detection, integral value calculation		
Number of input	S	2		
Input signal type	)	4 to 20 mA, 0 to 20 mA, 0 to 10 V, $-10$ to 10 V, 0 to 5 V, $-5$ to 5 V, 1 to 5 V, 0 to 1.25 V, $-1.25$ to 1.25 V (separate for each input), and $\pm 10$ -V user-set range (specified range within $-10.000$ V to 10.000 V)		
Scaling		Data to be stored in the allocated words in the CIO area must be scaled (Any mini- mum and maximum values can be set.) (2 inputs set separately.) Data can be con- verted at 0% to 100%.		
Data storage in <sup>.</sup>	the CIO Area	The value derived from carrying out the following processing in order of the actual process data in the input range is stored in four digits hexadecimal (binary values) in the allocated words in the CIO Area. 1) Mean value processing $\rightarrow$ 2) Scaling $\rightarrow$ 3) Zero/span adjustment $\rightarrow$ 4) Square root calculation $\rightarrow$ 5) Output limits		
Accuracy (25°C)		±0.05%		
Temperature coe	efficient	±0.008%/°C		
Resolution		1/64,000		
Input signal rang	je	For 4 to 20 mA, 0 to 20 mA, 0 to 10 V, 0 to 5 V, 1 to 5 V, 0 to 1.25 V inputs: -15 to 115%		
		For -10 to 10 V, -5 to 5 V, -1.25 to 1.25 V inputs: -7.5 to 107.5%		
Input impedance	9	For current inputs: 250 $\Omega$ (typical)		
		For voltage inputs: 1 M $\Omega$ min.		
Warmup time		10 min		
Conversion period		10 ms/2 inputs		
Maximum time to CPU Unit		Conversion period + one CPU Unit cycle		
Input error detec	ption	Check only for 4 to 20 mA and 1 to 5 V. Error detected for $-17.2\%$ (1.25 mA, 0.3125 V) or less and 112.5% (22 mA, 5.5 V) or more.		

lt	em	Specifications		
Operation at inp	ut disconnection	For 4 to 20 mA and 1 to 5 V: Stores –15% process value.		
		For all other ranges: Stores same process value as 0-V or 0-mA inputs.		
Input disconnection detection delay time		Approx. 1 s.		
Function	Mean value pro- cessing (input filter)	Calculates the moving average for the past specified number of process values (1 to 128 can be specified), and stores that value in the CIO Area as the process value.		
	Process value alarm	Process value 4-point alarm (LL, L H, HH), hysteresis, and ON-delay timer (0 to 60 s) are available.		
	Rate-of-change calculation	Calculates the amount of change per comparison time interval (1 to 16 s).		
	Rate-of-change alarm	Rate-of-change 2-point alarm (H, L), alarm hysteresis, and ON-delay timer (0 to 60 s are available, shared with process value alarm).		
	Square root cal- culation	When the maximum value for process value scaling is A and the minimum value is B, $\sqrt{(A - B) \times (input - B)} + B$		
		Drop-out: Output approx. 7% max. linear (output = input) characteristic		
		Note 1 The square root function can only be used when the maximum scaling value is greater than the minimum scaling value. The square root will not be found if the maximum is smaller than the minimum.		
		<b>Note 2</b> When the square root function is used, set the scaling values after square root calculation (e.g., for flow rates or other values) the process value scaling A and B settings.		
	Adjustment period control	When zero/span adjustment is executed, the date is internally recorded at the Unit. When the preset zero/span adjustment period and the notice of days remaining set in the Expansion Setting Area have elapsed, this function turns ON a warning flag to give notice that it is time for readjustment.		
	Peak and bot- tom detection	Detects the maximum (peak) and minimum (bottom) analog input values, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the peak and bottom values in the Expansion Control/Monitor Area.		
	Top and valley detection	This function detects the top and valley values for analog inputs, from when the Hold Start Bit (output) allocated to the Expansion Control/Monitor Area turns ON until it turns OFF. These values are stored as the top and valley values in the Expansion Control/Monitor Area.		
	Integral value calculation	This function calculates the analog input value's time integral. The integral value is cal- culated and output to the Expansion Control/Monitor Area when the Integral Value Calculation Start Bit in the Expansion Control/Monitor Area is turned ON.		
Isolation		Between inputs and between inputs and PLC signals: Isolation by transformer and photocoupler.		
Insulation resista	ance	20 M $\Omega$ (at 500 V DC) between all inputs		
Dielectric streng	th	Between inputs: 1,000 V AC, at 50/60 Hz, for 1 min, leakage current 10 mA max.		
External connec		Terminal block (detachable)		
Unit number set	tings	Set by rotary switches on front panel, from 0 to 95.		
Indicators		Four LED indicators on front panel (for normal operation, errors detected at the Direct Current Input Unit, and errors detected at the CPU Unit).		
Front panel connector		Sensor input connector terminal block (detachable)		
Alarm time for CPU Unit cycle time		0.3 ms		
Current consum	ption	5 V DC at 180 mA max.		
External power s	supply	24 V DC +10%/-15% 90 mA max., inrush current: 20 A for 1 ms max. (The external 24-VDC power supply must be isolated.)		
Dimensions		$31 \times 130 \times 65 \text{ mm} (W \times H \times D)$		
Weight		150 g max.		
Standard access	sories	Short bars (for current input)		

### Accuracy and Resolution in ±10-V User-set Range

The  $\pm 10$ -V user-set range allows the input signal's input range to be set to any range within -10.000 V to 10.000 V. Accuracy and resolution, however, are not determined by the input range, but rather by the measurable input range (-10.000 V to 10.000 V). Therefore, accuracy and resolution do not change even if a narrow input range is set.

### **DM Area Allocations**

First word: word m.  $m = D20000 + unit number \times 100$  (unit number: 0 to 95)

DM Area	DM Area address		Data range			Data contents

m+98		0 to 5	0000 to 0005 hex		Area of Expansion 0: Not used; 1: D	on Setting Area M; 2: CIO; 3: W; 4: H; 5: EM	
m+99		0 to 32767	0000 to 7FFF hex		First Word in Exp	pansion Setting Area	

Note

1. The ERC indicator on the Unit's front panel will light if an out-of-range setting is made in either Setting Group 1 (continually refreshed area) or 2 (initial settings area), or in the Expansion Setting Area. The offset from word m to the first address containing the out-of-range error will be stored as the Address of Data Range Error in the DM Area in four digits hexadecimal.

If the first memory address where the out-of-range error occurred is in the Expansion Setting Area, the Address of Data Range Area will be +100 or later. If the first word of the Expansion Setting Area has the error, the Address of Data Range Area will be +100.

- 2. When specifying an expansion setting area, be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
- 3. When specifying the first word in an expansion setting area, be sure that the end of the memory area is not exceeded.

### Expansion Setting Area Allocations

First word: word o. o = address specified in word m+99 in the area specified by word m+98 in the DM Area.

DM Area address		Data range		Default	Data contents
Input No. 1	Input No. 2	Decimal	Hexadecimal		
Setting Grou word m conta	u <b>p 3 (initial se</b> ains other than	ttings area): Par 12345 when the	ameters that are t PLC is turned ON	transferred one tir I or the Direct Cu	ne from the CPU Unit to the Direct Current Input Unit if rrent Input Unit is restarted.
					Expansion Control/Monitor Area Settings
0		0 to 5	0000 to 0005 hex		Expansion Control/Monitor Area allocation 0: Not used. 1: DM; 2: CIO; 3: W; 4: H; 5: EM
0+1		0 to 32767	0000 to 7FFF hex		Expansion Control/Monitor Area first word
					Zero/span adjustment supplement
0+2	0+13	0 to 32000	0000 to 7D00 hex	10000 (2710 hex)	Span adjustment position (Input span percentage)
0+3	o+14	-32000 to 32000	8300 to FFFF hex, 0000 to 7D00 hex	0 (0000 hex)	Zero adjustment position (Input span percentage)
0+4	0+15	0 to 9999	0000 to 270F hex	365 (016D hex)	Zero/span adjustment period (Unit: Days)
0+5	0+16	0 to 9999	0000 to 270F hex	30 (001E hex)	Notice of days remaining (Unit: Days)
	•		•	•	Not used
0+6	o+17			0 (0000 hex)	Not used
0+7	o+18				
0+8	o+19				
					Top and valley hold
0+9	o+20	0 to 32000	0000 to 7D00 hex	40 (0028 hex)	Hysteresis
					Integral value calculation
o+10	0+21	0, 1	0000, 0001 hex	0 (0000 hex)	Integer unit 0: Minutes; 1: Hours
					Not used
o+11	0+22			0 (0000 hex)	Not used.
o+12	o+23				

Note

- 1. When specifying an expansion control/monitor area be sure that it does not overlap with other areas that are being used. If areas overlap, the words that are allocated may be overwritten, resulting in unexpected operation.
  - 2. When specifying the first word in an expansion control/monitor area be sure that the end of the memory area is not exceeded.

### **<u>CIO Area Allocations</u>**

First word: word n. n = $2000 + unit number \times 10$	(unit number: 0 to 95)
--	------------------------

Direction	Word	Bit	1	Name	Data range	Contents	
Direct Current Input Unit to CPU Unit	n	00	D Input No. 1 Process value LL (low low limit) alarm		0, 1	0: Process value > Set value 1: Process value ≤ Set	
		01		Process value L (low limit) alarm	0, 1	value	
		02		Process value H (high limit) alarm	0, 1	0: Process value < Set value 1: Process value ≥ Set	
		03		Process value HH (high high limit) alarm	0, 1	value	
		04	Input No. 2	Process value LL (low low limit) alarm	0, 1	Same as for input No. 1.

### Note

- In both of the above cases, leave all unused inputs open between the positive and negative terminals (e.g., between B2 and B3 for voltage input No. 1).
- Always ground the GR terminal on the Power Supply Unit of the PLC.
- If the input device uses a voltage generator, temperature compensator, or similar device, then ground the input device if it has a ground terminal.
- Always short-circuit the V and I terminals when using current input.

### **Terminal Block Diagram**

### Error Processing

### Conversion Data Does Not Change.

Probable cause	Remedy
The gain for span adjustment is set to 0.	Set the gain for span adjustment to a value other than 0.
The minimum and maximum val- ues for process value scaling are either the same or are set extremely low.	Set the minimum and maximum values correctly.
The input signal type or process value range is set incorrectly.	Check and reset the input signal type and the process value range settings.
An input device is malfunctioning, input wiring is faulty, or wiring is disconnected.	Check whether the input voltage or current has changed. Check for faulty or disconnected wir-ing.
	Check whether an input error has been detected in the I/O Area.

#### Values are Not Converted as Intended.

Probable cause	Remedy
The input signal type or process value scaling is set incorrectly.	Check and reset the input signal type and the process value scaling settings.
The zero/span adjustment data is incorrect.	Check and correct the zero/span adjustment set- tings.
The square root function is operat- ing.	Set the square function so that it does not oper- ate.

### Converted Values are Unstable.

Probable cause	Remedy
Input signals are being affected by external noise.	Change the connection paths of the input signal lines. (Separate them from sources of noise or use shielded cable.)
	Insert 0.01- $\mu$ F to 0.1- $\mu$ F ceramic capacitors between the I+ and COM input terminals.
	Increase the number of values for calculating the moving average in mean value processing.
The scaling value is greater than the Unit's resolution.	Reduce the scaling value.

# Appendix A

# **Supplementary Explanation of Functions**

The following supplements the explanation given in 1-2 Features and Functions.

# Changing Set Values during Output of Process Value (or Instantaneous Value) Alarm or Rate-of-change Alarm

# HH (High High Limit) and H (High Limit) Alarms

When the alarm set value is raised while the alarm output is ON, the alarm output will be turned OFF when the following condition is satisfied.

Input value < (alarm set value after change - hysteresis)

The alarm output will first turn OFF when the input value falls below the set value (with the hysteresis included).

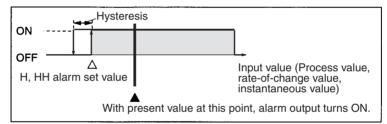

### LL (Low Low Limit) and L (Low Limit) Alarms

When the alarm set value is lowered while the alarm output is ON, the alarm output will be turned OFF when the following condition is satisfied.

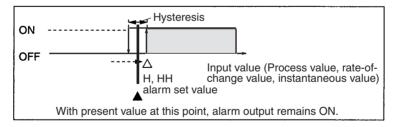

Input value > (alarm set value after change + hysteresis)

When the hysteresis part alone of the input value is greater than the set value, the alarm output will turn OFF for the first time.

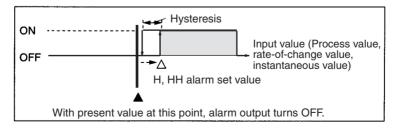

### Example: HH and H Limit Alarms

Alarm set value raised.

Alarm set value further raised.

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit (100 mV)	CS1W-PTR02

# Alarm Operation when Upper Limit Is Less Than Lower Limit

Process value (instantaneous value) and rate-of-change value alarm set values can be set freely regardless of the relative sizes of HH > H > L > LL.

Example: H < L, or HH < H.

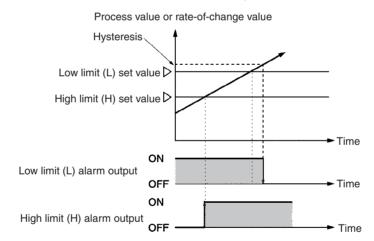

The alarm output operation is determined purely by the relative sizes of the input value (screening value) and alarm set value, as shown below.

### **HH and H Limit Alarms**

When the input value is greater than the alarm set value, the alarm output is turned ON.

### LL and L Limit Alarms

When the input value is less than the alarm set value, the alarm output is turned ON.

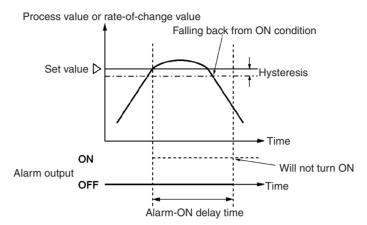

Applicable Units	Isolated-type Thermocouple Input Units	CS1W-PTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit (100 mV)	CS1W-PTR02

**Note** Rate-of-change value alarm is not available for CS1W-PTS5□/PDC55, and CJ1W-PTS51/PTS52. Process value alarm only.

# Alarm Output Operation when Falling Back from Alarm Condition Before Alarm-ON Delay Time Elapses

If inputs fall back from the alarm-ON condition (including hysteresis) before the alarm-ON delay time has elapsed, the alarm output will not turn ON.

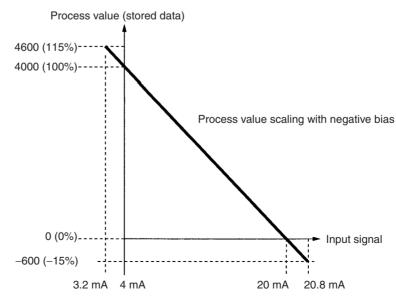

Applicable Units	Isolated-type Thermocouple Input Units	CS1WPTS01-V1/11/51/55, CJ1W-PTS51/15
	Isolated-type Resistance Thermometer Input Units	CS1W-PTS02/03/12/52/56, CJ1W-PTS52/16
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Units	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit (100 mV)	CS1W-PTR02

# **Setting Process Value Scaling with Negative Bias**

With process value scaling in industrial units, a negative bias can be set by reversing the maximum and minimum values in the range.

Example: CS1W-PDC01 Isolated-type Direct Current Input Unit

The following values can be set for an input signal of 4 to 20 mA: Maximum process value in range = 0, minimum process value in range = 4000.

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS02/03/12, CJ1W-PTS16
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Unit	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit (100 mV)	CS1W-PTR02

# Alarm Operation during Process Value Scaling with Negative Bias

During process value scaling with negative bias, the alarm operates on the process value after scaling, and not on the input signal. Consequently, the operation is the same as for normal bias, as shown below.

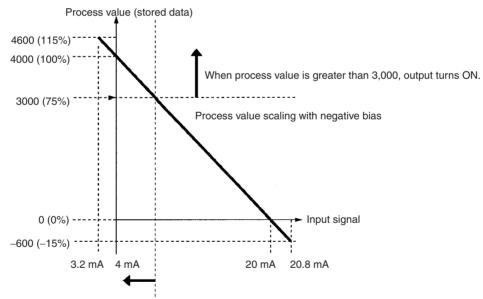

### **HH and H Limit Alarms**

When the input value is greater than the alarm set value, the alarm output is turned ON.

### LL and L Limit Alarms

When the input value is less than the alarm set value, the alarm output is turned ON.

Example: If the maximum process value in the range is 0 and minimum process value in the range is 4,000 for an input signal of 4 to 20 mA, and if the H (high limit) alarm set value is 3,000, the alarm output will turn ON when the process value is greater than 3,000 (when the input signal is less than 8 mA).

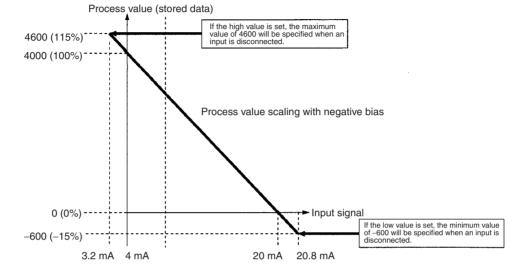

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS02/03/12, CJ1W-PTS16
	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Unit	CS1W-PDC01/11/55, CJ1W-PDC15
	Isolated-type Pulse Input Unit	CS1W-PPS01
	Power Transducer Input Unit	CS1W-PTR01
	Analog Input Unit (100 mV)	CS1W-PTR02

# Maximum/Minimum Value for when Input Disconnection Occurs during Process Value Scaling with Negative Bias

If an input is disconnected during process value scaling with negative bias, either the maximum or minimum process value will be specified.

If the process value overrange direction is high, the maximum process value will be specified.

If the process value overrange direction is low, the minimum process value will be specified.

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS01-V1/11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS02/03/12, CJ1W-PTS16

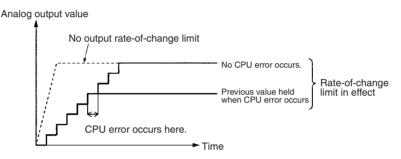

# **Output Hold when CPU Unit Error Occurs**

In the following cases, the CS1W-PMV01/PMV02 Isolated-type Analog Output Unit will hold either a specified preset value or the analog output value prior to the error for output when the CPU Unit is restored to normal operation.

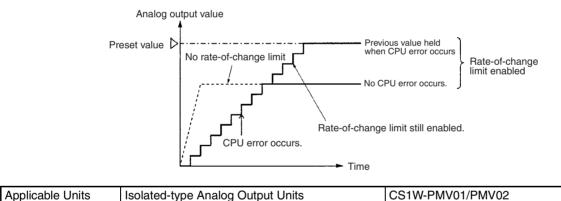

- A fatal error (including user-defined FALS execution) occurs
- A CPU error occurs
- A load break occurs

When the CPU Unit is restored to normal operation, the output value in the CIO Area will be output.

- **Note** If a CPU error occurs while the output rate-of-change limit function is operating, the output hold function will operate as follows:
  - If previous value hold has been specified, then the value prior to the CPU error will be held for output.

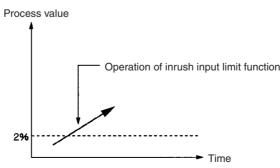

• When preset value hold has been specified, the output rate-of-change limit will remain in effect even during the change to the preset value, and the rate of change will be limited.

# **Inrush Input Limit Function**

The inrush input limit function will not operate if the process value is already greater than 2% when the power supply to the PLC is turned ON. The inrush input limit function will operate only when the process value rises above 2% from less than 2% at startup.

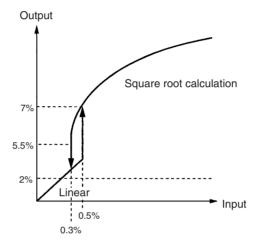

Applicable Units	Analog Input Unit (100 mV)	CS1W-PTR02
	Power Transducer Input Unit	CS1W-PTR01

# **Hysteresis during Square Root Calculations**

During square root calculations, outputs of approximately 7% or less have linear characteristics (i.e., output = input). Hysteresis exists, however, when switching between square root characteristics and linear characteristics, as shown below.

During input rise: Switching from linear characteristics to square root characteristics at 0.5% input (output of approximately 7%).

During input fall: Switching from square root characteristics to linear characteristics at 0.3% input (output of approximately 5.5%).

Applicable Units	Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01
	Isolated-type Direct Current Input Unit	CS1W-PDC01/11/55, CJ1W-PDC15

# **Adjustment Period Control**

# Final Adjustment Date Not Stored in the Unit's External FROM (Initial Status)

The set values are as follows:

- The 4-byte area (2 words) for the final adjustment date is set to FFFF.
- The Zero/span Adjustment Period Notice Bit is set to 1 (notice period).
- The Zero/span Adjustment Period End Bit is set to 1 (adjustment ended).

# Error in Final Adjustment Date Stored in Unit's External FROM when Power is Turned ON

The ERC indicator is ON and the adjustment period control function does not operate properly. Restart the Unit. The set values are as follows.

- The External FROM Error Flag is set to 1 (external FROM error).
- The 4-byte area (2 words) for the final adjustment date is set to FFFF.
- The Zero/span Adjustment Period Notice Bit is set to 1 (notice period).
- The Zero/span Adjustment Period End Bit is set to 1 (adjustment ended).

The ERC indicator is ON and the adjustment period control function does not operate properly when the Unit is restarted. Update the final adjustment date again.

The set values are as follows.

- The External FROM Error Flag is set to 1 (external FROM error).
- **Note** If the CPU Unit's internal clock information is refreshed after updating the final adjustment date, the warning will not be accurate. The Zero/span Adjustment Update Bit remains ON (1: Update adjustment date) while writing external FROM, so do not turn OFF the PLC.

Applicable Units	Isolated-type Thermocouple Input Unit	CS1W-PTS11, CJ1W-PTS15
	Isolated-type Resistance Thermometer Input Unit	CS1W-PTS12, CJ1W-PTS16
	Isolated-type Direct Current Input Unit	CS1W-PDC11, CJ1W-PDC15

# **Integral Value Calculation**

# **Integral Value Unit: Hour**

The process value is calculated using an integral width of 3.6 s (1/1,000th of an hour), and the total is output to 4 bytes (2 words) of memory.

An integral value of 1,000 indicates that a process value of 1,000 has continued for one hour.

# **Integral Value Unit: Minute**

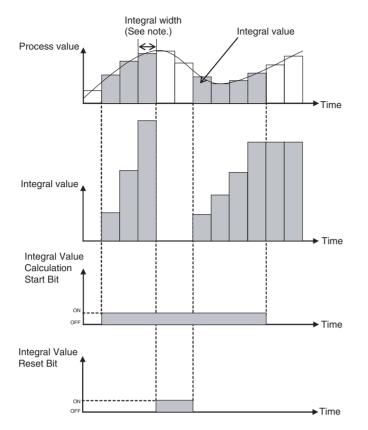

The process value is calculated using an integral width of 60 ms (1/1,000th of a minute), and the total is output to 4 bytes (2 words) of memory.

An integral value of 1,000 indicates that a process value of 1,000 has continued for one minute.

Example: Process value: 1,000 (constant)

Integral unit: hour

Time lapsed (hours)	Integral value
0.5	500
1	1,000
2	2,000
3	3,000

Note The integral width for one integral value is as follows:

Unit	Integral width
Hour	3.6 s (1/1,000th of an hour)
Minute	60 ms (1/1,000th of a minute)

### **Integral Value Overflow**

The integral value will become undefined if the integral value exceeds the data range (-2147483648 to 2147483647) during integral calculation. An integral value overflow will occur after a minimum of 45 days has lapsed from the start of integral calculation.

Example: Integral value overflow (minimum conditions). The table shows the integral values for the following minimum conditions.

- Process value: -32768 (constant)
- Integral unit: Minute

Number of days lapsed (days)	Integral value
0	0
1	-47185920
2	-94371840
to	to

Applicable Units Isolated-type Direct Current Input Unit	CS1W-PDC11, CJ1W-PDC15
--	------------------------

# Appendix B Zero/Span Adjustment Example

The Analog I/O Unit's zero/span adjustment can be performed as described below using a calibration device.

- *1,2,3...* 1. Connect the Programming Device to the CPU Unit.
  - 2. Connect a suitable calibration device as shown in the following table to the Analog I/O Unit.

Name	Model	Calibration device
Isolated-type Thermocouple Input Unit	CS1W-PTS01-V1	Voltage and current generator
	CS1W-PTS11	
	CS1W-PTS51	
	CS1W-PTS55	
	CJ1W-PTS51	
	CJ1W-PTS15	
Isolated-type Resistance Thermocouple Input Unit (Pt100, JPt100)	CS1W-PTS02	Variable resistor
Isolated-type Resistance Thermocouple Input Unit (Ni508.4)	CS1W-PTS03	
Isolated-type Resistance Thermocouple	CS1W-PTS12	
Input Unit (Pt100, JPt100, JPt50, Ni508.4)	CJ1W-PTS16	
Isolated-type Resistance Thermocouple	CS1W-PTS52	
Input Unit (Pt100, JPt100)	CS1W-PTS56	
Isolated-type Resistance Thermocouple Input Unit (Pt100, JPt100)	CJ1W-PTS52	
Isolated-type 2-Wire Transmitter Input Unit	CS1W-PTW01	Voltage and current generator
Isolated-type Direct Current Input Unit	CS1W-PDC01	Voltage and current generator
	CS1W-PDC11	
	CS1W-PDC55	
	CJ1W-PDC15	
Analog Input Unit (100 mV)	CS1W-PTR02	Voltage generator
Power Transducer Input Unit	CS1W-PTR01	Voltage generator
Isolated-type Pulse Input Unit	CS1W-PPS01	Pulse generator
Isolated-type Analog Output Unit	CS1W-PMV01	Voltage and current meter
	CS1W-PMV02	Voltage meter

- 3. Turn ON the power to the PLC, and wait approximately 10 minutes for the Unit to warm up. The CS1W-PTS5 and CJ1W-PTS5 require approximately 30 minutes to warm up. The CS1W-PTS01-V1, CS1W-PTS11, and CJ1W-PTS15 require approximately 45 minutes to warm up.
- 4. Make the adjustments.

### **Input Units**

- 1. Input a signal equivalent to 0% from the calibration device, and check the process value in the CPU Unit's CIO Area using the Programming Device. If the value is abnormal, change the zero adjustment value in the DM Area, and adjust the offset (parallel movement) value.
  - 2. Input a signal equivalent to 100% from the calibration device, and check the process value in the CPU Unit's CIO Area using the Programming Device. If the value is abnormal, change the span adjustment gain value in the DM Area, and adjust the gain (bias).

### Zero/Span Adjustment Example

### Appendix B

Note For the CS1W-PTS01-V1/PTS11/PTS55 or CJ1W-PTS15 Isolated-type Thermocouple Input Unit, short between the terminals of the cold junction sensor on the top of the Isolated-type Thermocouple Input Unit. This will stop the Isolated-type Thermocouple Input Unit to discontinue cold junction compensation. Then input a standard thermocouple value of 0°C (standard thermal power generation value, IEC60584-1) to the calibration mV signal.

### **Output Units**

- **1,2,3...** 1. Set an analog output value equivalent to 0% in the CPU Unit's CIO Area. Check the signal using the calibration device. If the value is abnormal, change the zero adjustment value in the DM Area, and adjust the offset (parallel movement) value.
  - 2. Set an analog output value equivalent to 100% in the CPU Unit's CIO Area. Check the signal using the calibration device. If the value is abnormal, change the span adjustment gain value in the DM Area, and adjust the gain (bias).

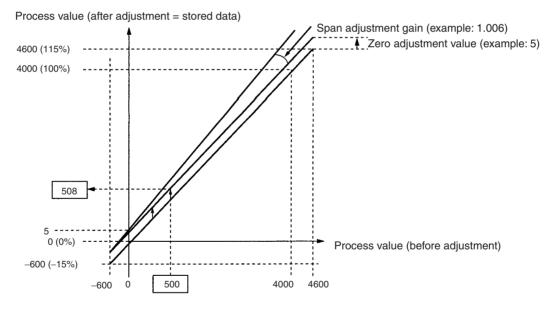

Adjust the zero/span according to the following equation.

Process value after adjustment = (input value – minimum process value in range) x DM Area span adjustment gain value + minimum process value in range + DM Area zero adjustment value

Example: Minimum process value in range = 0; maximum process value in range = 4,000; span adjustment gain =  $10060 \times 0.0001 = 1.0060$ ; zero adjustment value = 5

If the input value is 500, the process value after adjustment will be as follows:

Process value after adjustment =  $(500 - 0) \times 1.0060 + 0 + 5 = 508$ .

# Zero/span Adjustment Example for Any Points (CS1W-PTS11/12, PDC11, CJ1W-PTS15/16, PDC15)

Use the following adjustment equation to perform zero/span adjustment for any points.

Process value after adjustment =  $(X - B) \times ((C - A) \times E - B + A)/(C - B) + D + B$ 

- X: Input value
- A: Zero point of allocated DM Area
- B: Zero adjustment position (process value range)
- C: Span adjustment position (process value range)
- D: Zero adjustment value for allocated DM Area
- E: Span adjustment gain for allocated DM Area

**Note** The zero adjustment position and span adjustment position are percentages of the input span in the Expansion Setting Area settings, so they can be obtained using the following equations.

Zero adjustment position = (Span point set in the allocated DM Area – Zero point set in the allocated DM Area)  $\times$  Zero adjustment position set in the Expansion Setting Area + Zero point set in the allocated DM Area

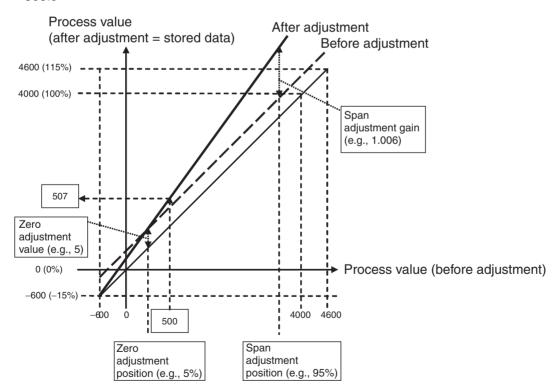

Span adjustment position = (Span point set in the allocated DM Area – Zero point set in the allocated DM Area)  $\times$  Span adjustment position set in the Expansion Setting Area + Zero point set in the allocated DM Area

Example: The values are calculated for the conditions in the following table.

Item	Value
Zero point set in the Allocated DM Area	0
Span point set in the Allocated DM Area	4000
Span adjustment gain set in the Allocated DM Area	10060 (10060 × 0.0001 = 1.0060)
Zero adjustment position set in the Allocated DM Area	5
Zero adjustment position set in the Expansion Setting Area	500 (500 ×0.0001 = 5%)
Span adjustment position set in the Expansion Setting Area	9500 (9500 ×0.0001 = 95%)
Input value	500

After adjustment, the process value is as follows:

Zero adjustment position =  $(4000 - 0) \times 0.0500 + 0 = 200$ Span adjustment position =  $(4000 - 0) \times 0.9500 + 0 = 3800$ Process value after adjustment =  $(500 - 200) \times ((3800 - 0) \times 1.0060 - 200 + 0)/(3800 - 200) + 5 + 200 = 506.9$

# **Revision History**

A manual revision code appears as a suffix to the catalog number on the front cover of the manual.

The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

Revision code	Date	Revised content
1	April 2000	Original production
02	January 2002	"CS1 Series" was changed to "CS Series" and "-V1" was added to the model number CS1W-PTS01 throughout the manual. In addition, the following changes were made.
		Page 39: Changes made to diagram and notes 1 and 2, and another note added.
		Page 40: Terminal numbers changed
		Page 128: Changes made to equations in 3 places.
03	May 2002	Information on the CS1W-PMV02 Isolated-type Analog Output Unit was added throughout the manual.
04	August 2003	"PC" was changed to "PLC" throughout the manual.
		Changes and additions were made to add the CS1W-PTS11, CS1W-PTS12, and CS1W-PDC11.
05	February 2004	Changes and additions were made to add the CS1W-PTS51/PTS52 and CJ1W-PTS51/PTS52.
06	June 2004	Changes and additions were made to add the CS1W-PTS55/PTS56 and PDC55.
07	March 2005	Changes and additions were made to add the CJ1W-PTS15/PTS16 and PDC15.
